A microscopic image of skeletal muscle tissue. The image shows multiple muscle fibers with distinct striations (alternating light and dark bands). The fibers are arranged in parallel, and several nuclei are visible, located peripherally to the fibers. The overall appearance is that of a highly organized, striated muscle tissue.

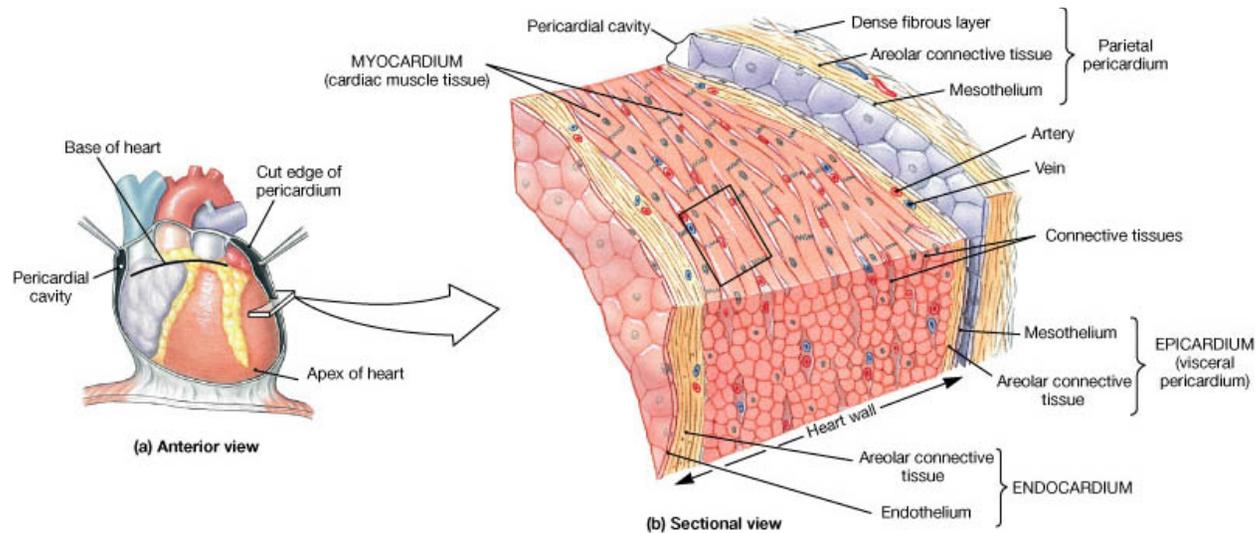

Skeletal Muscle

Types of muscle

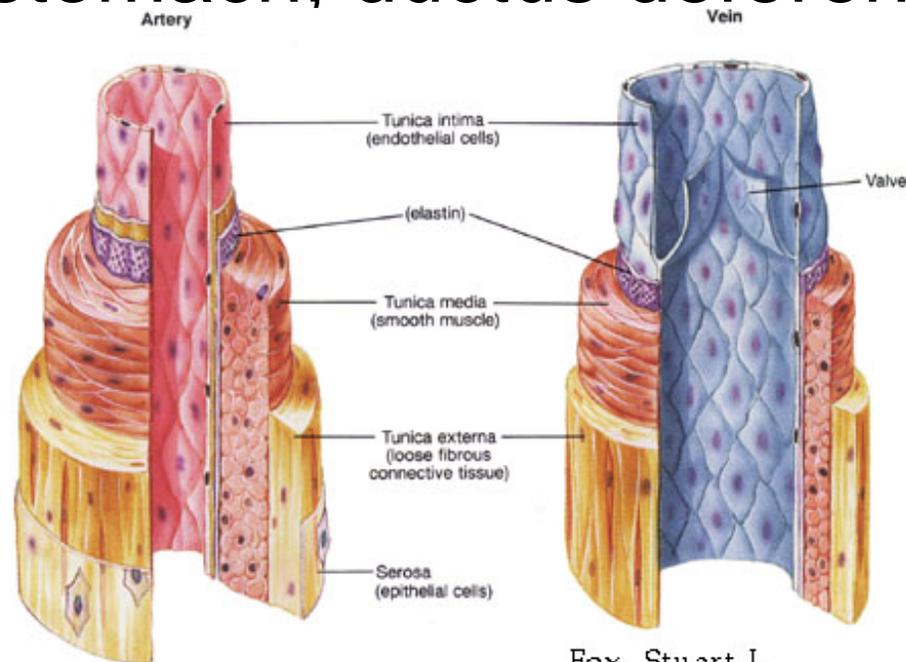

- Skeletal muscle-moves the skeleton by pulling on the tendons that are connected to the bones

- Cardiac muscle-pumps blood through the heart and blood vessels

- Smooth muscle-various functions in many diverse organs (arrector pili muscle, iris, uterus, stomach, ductus deferens)

Fox, Stuart I.
Human Physiology 4th
Brown Publishers

Function of skeletal muscle

- Locomotion
- Maintain posture
- Support of soft tissues
- Regulation of orifices
- Maintain body temperature

Muscle fiber microanatomy

- Sarcolemma-plasma membrane of muscle cells
- Sarcoplasm-cytoplasm of muscle fibers
- Skeletal muscle fibers have multiple nuclei
 - fusion of multiple myoblasts

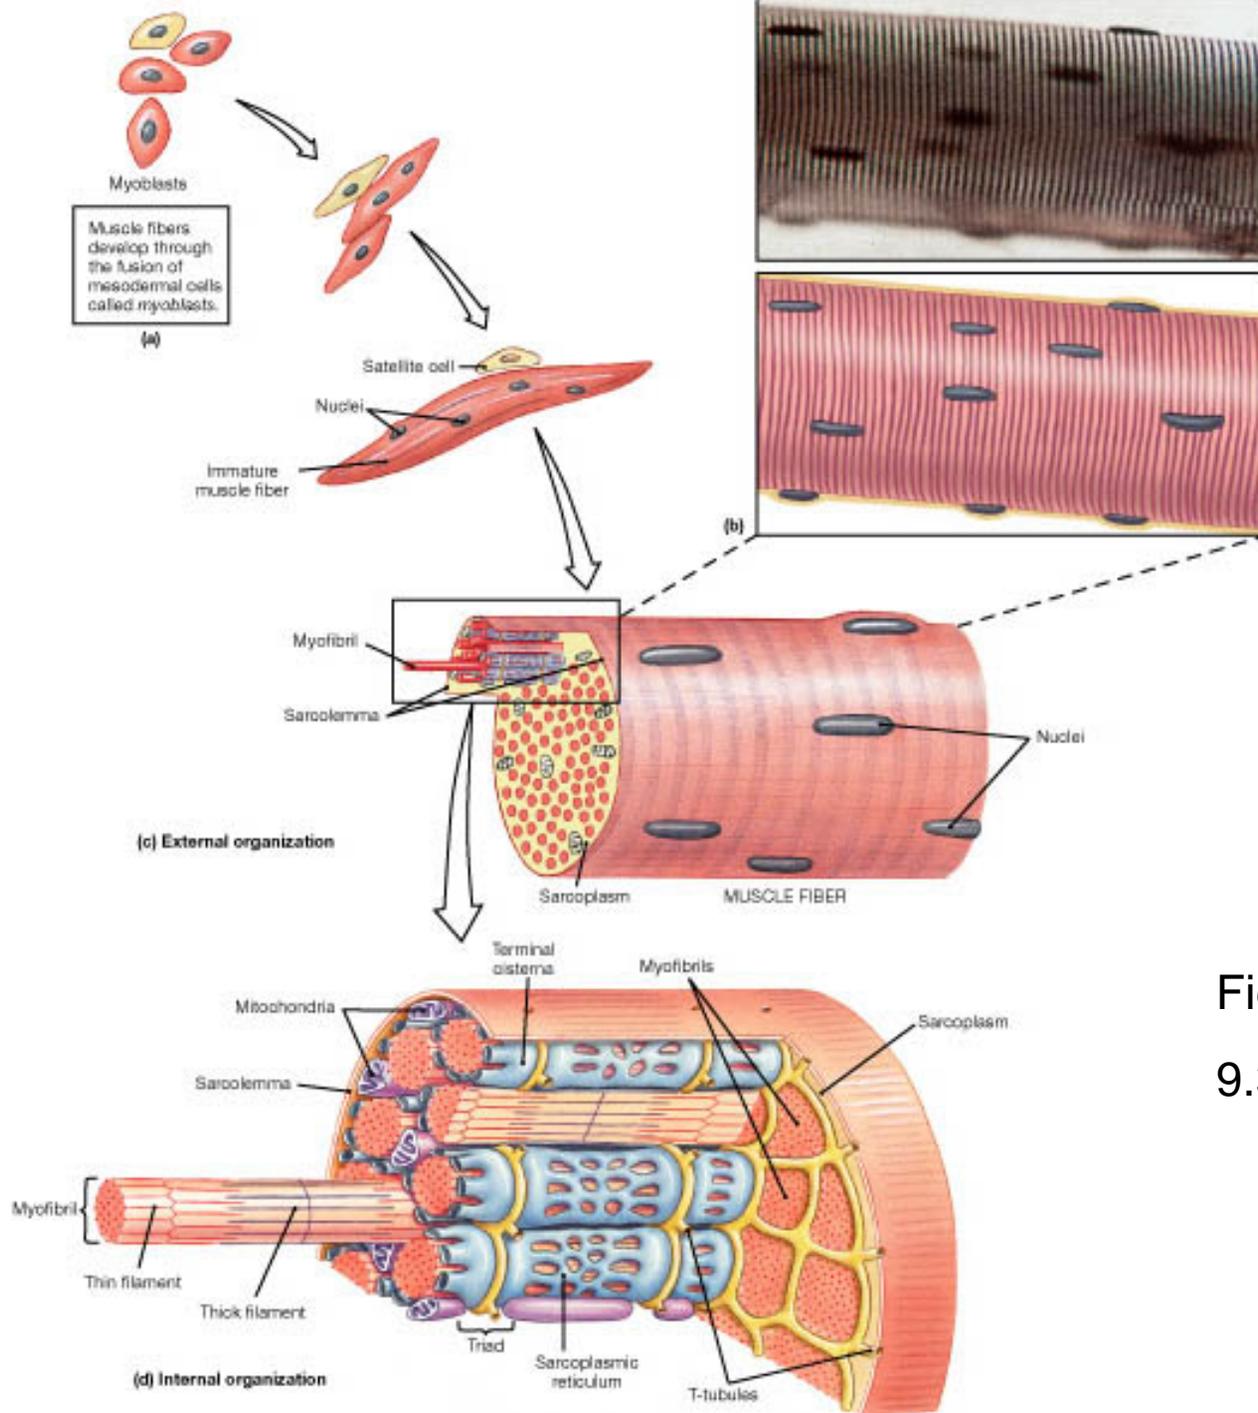

Fig
 9.3

- Myofibrils-bundles of myofilaments
- Myofilaments-two types:
 - Actin-thin filaments
 - Myosin-thick filaments

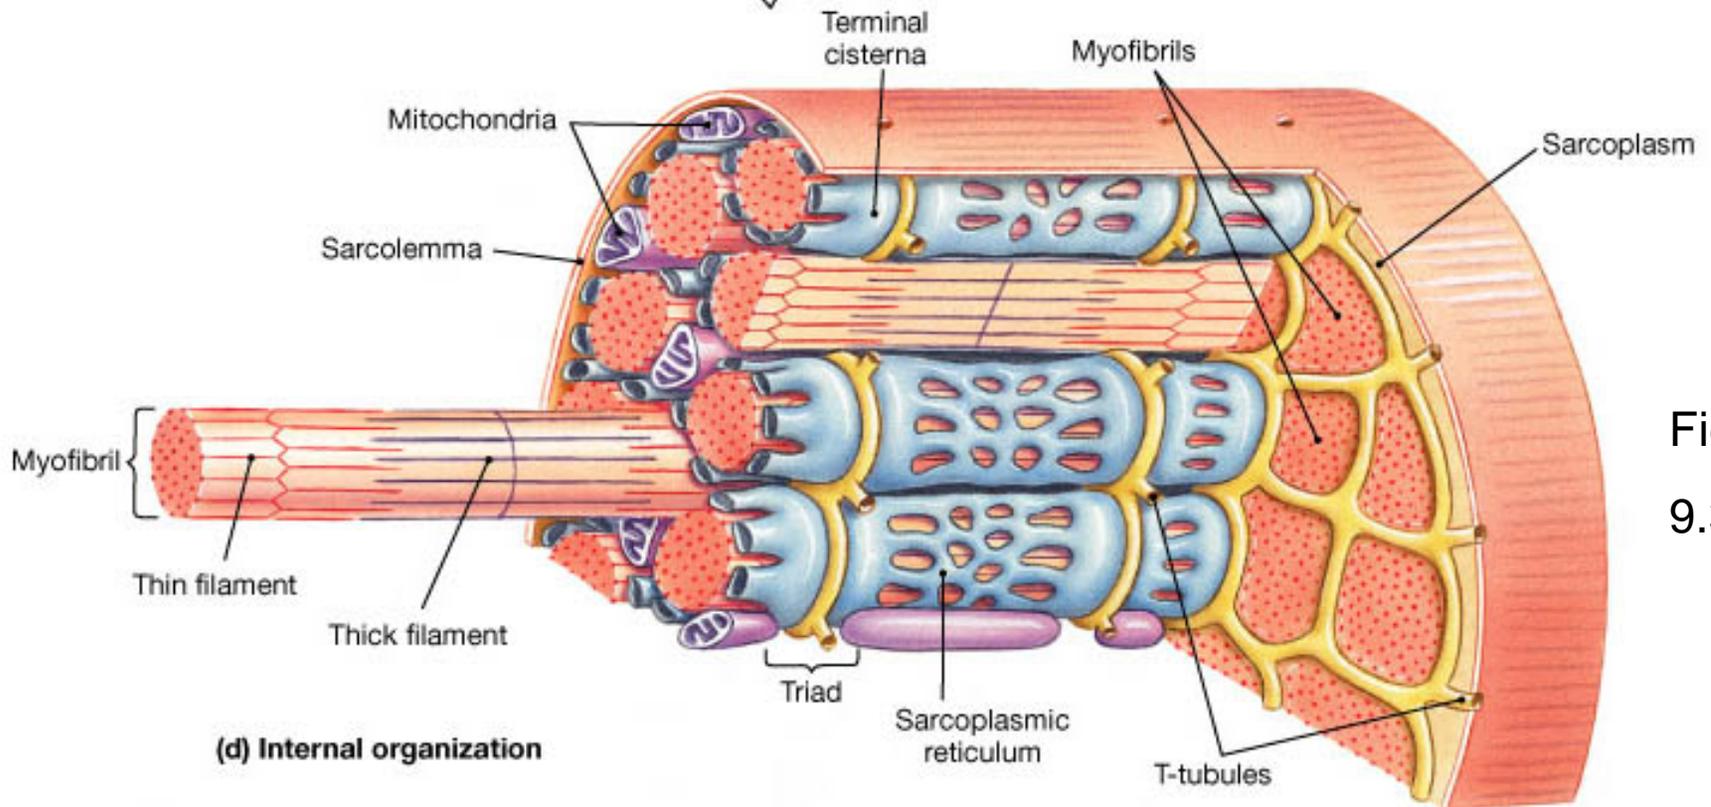

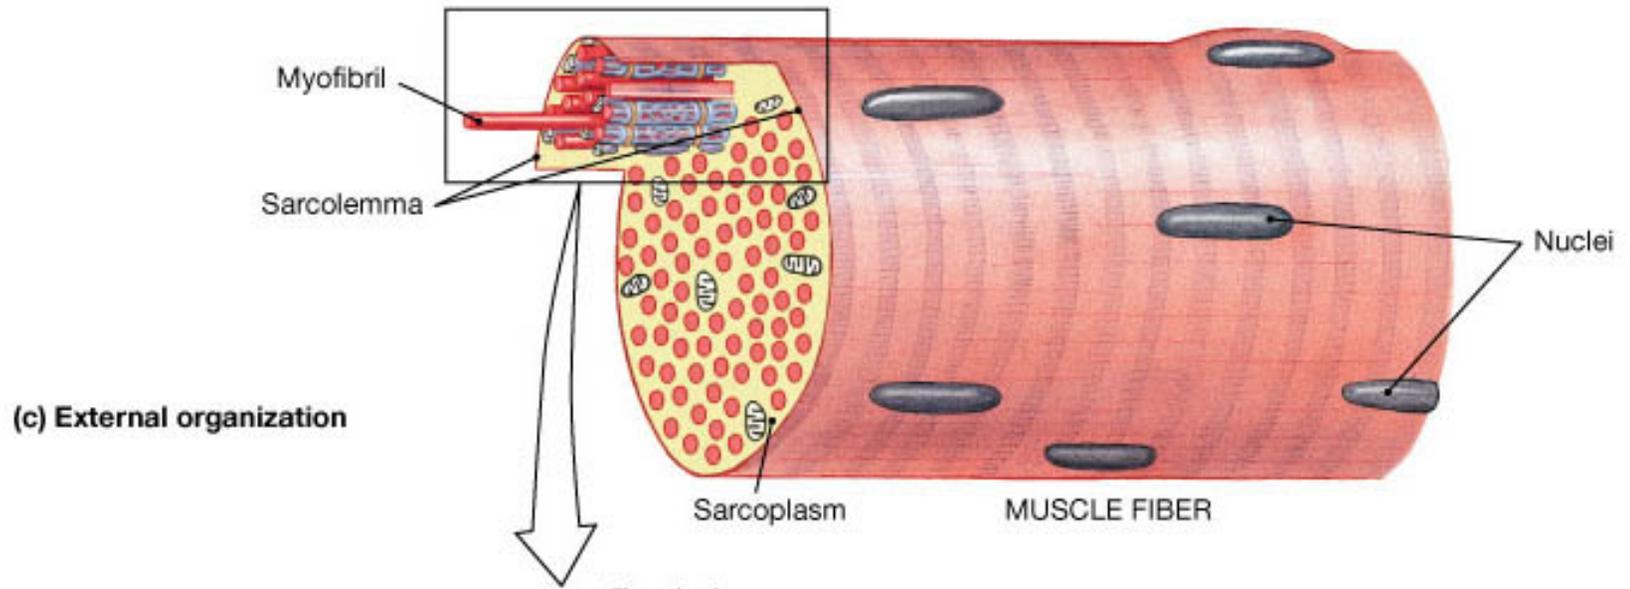

Fig
9.3

- Sarcoplasmic reticulum- SR-ER in muscle fibers (release Ca for muscle contraction)
- Terminal cisternae-widened ends of the SR
- Transverse tubules (T-tubules)
- Triad-two terminal cisternae and the t-tubule between them

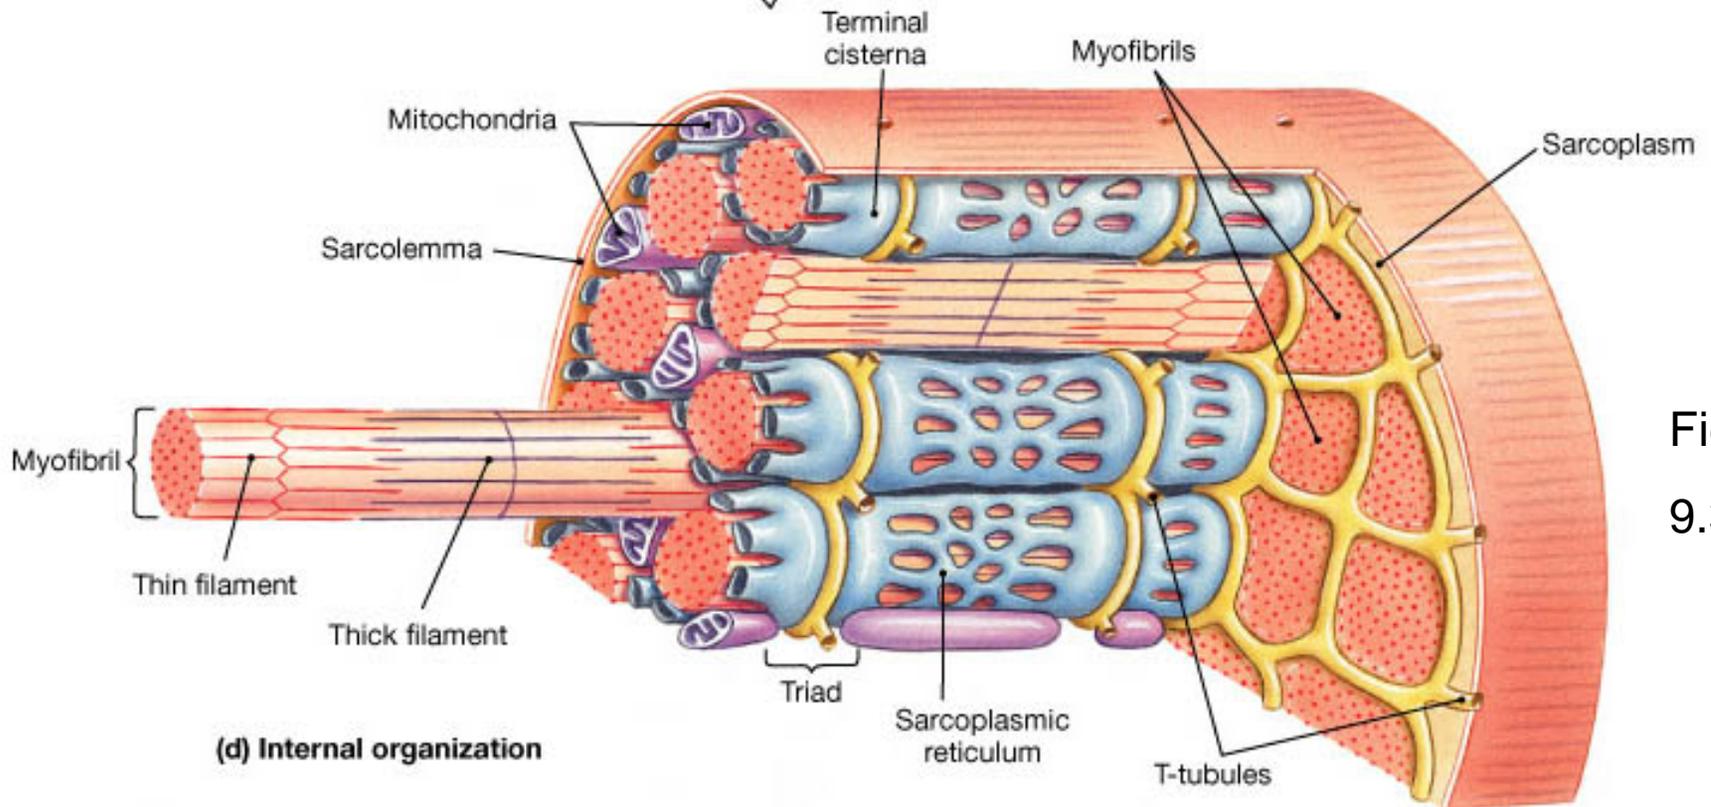

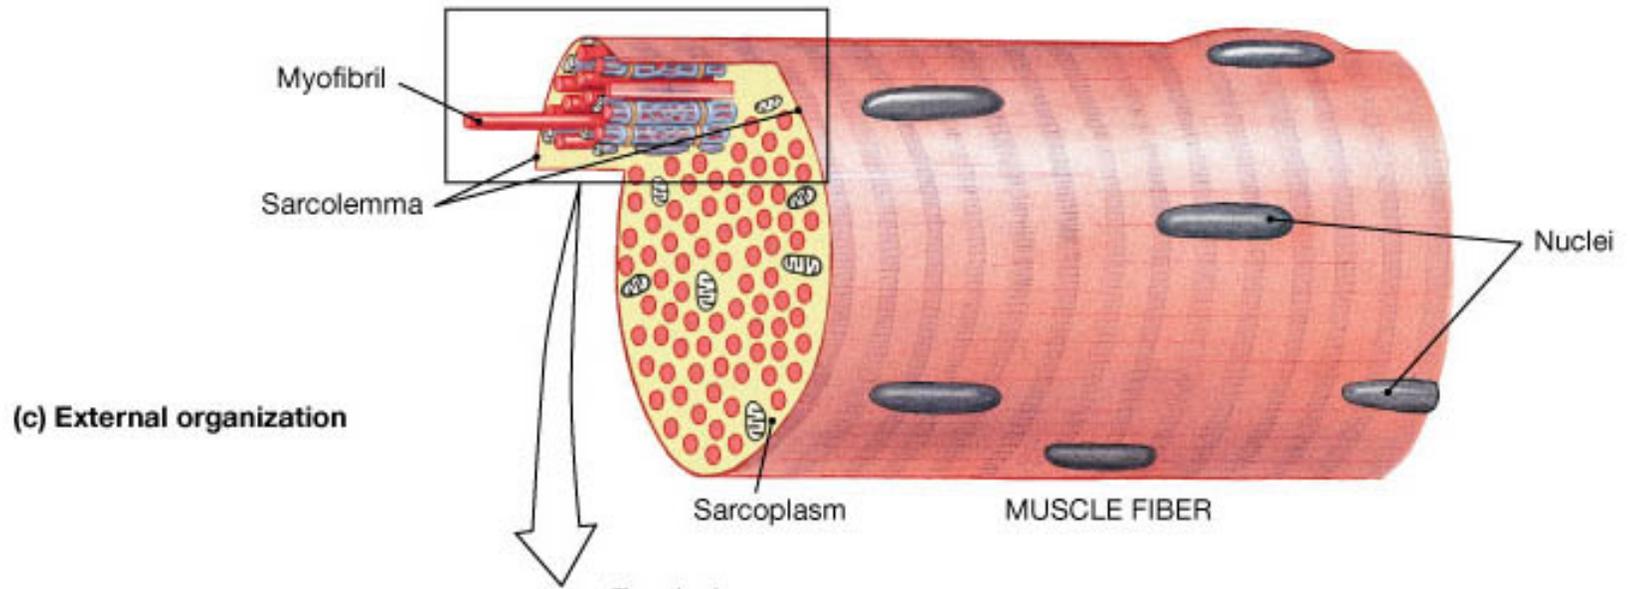

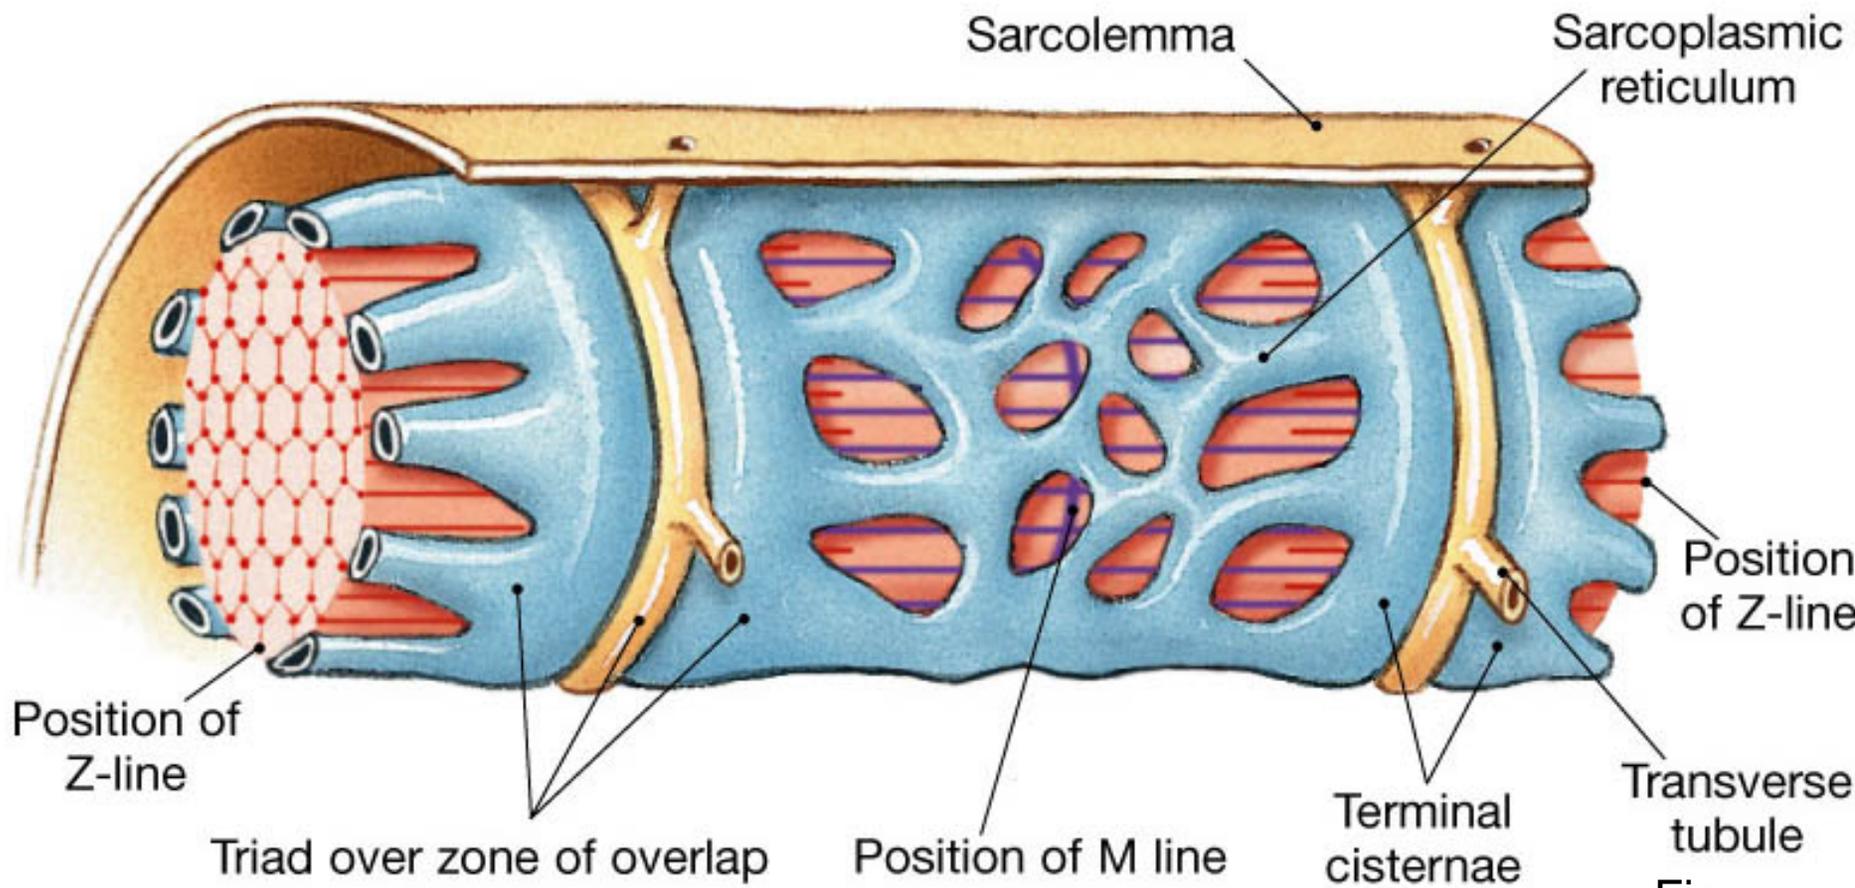

Fig
9.3

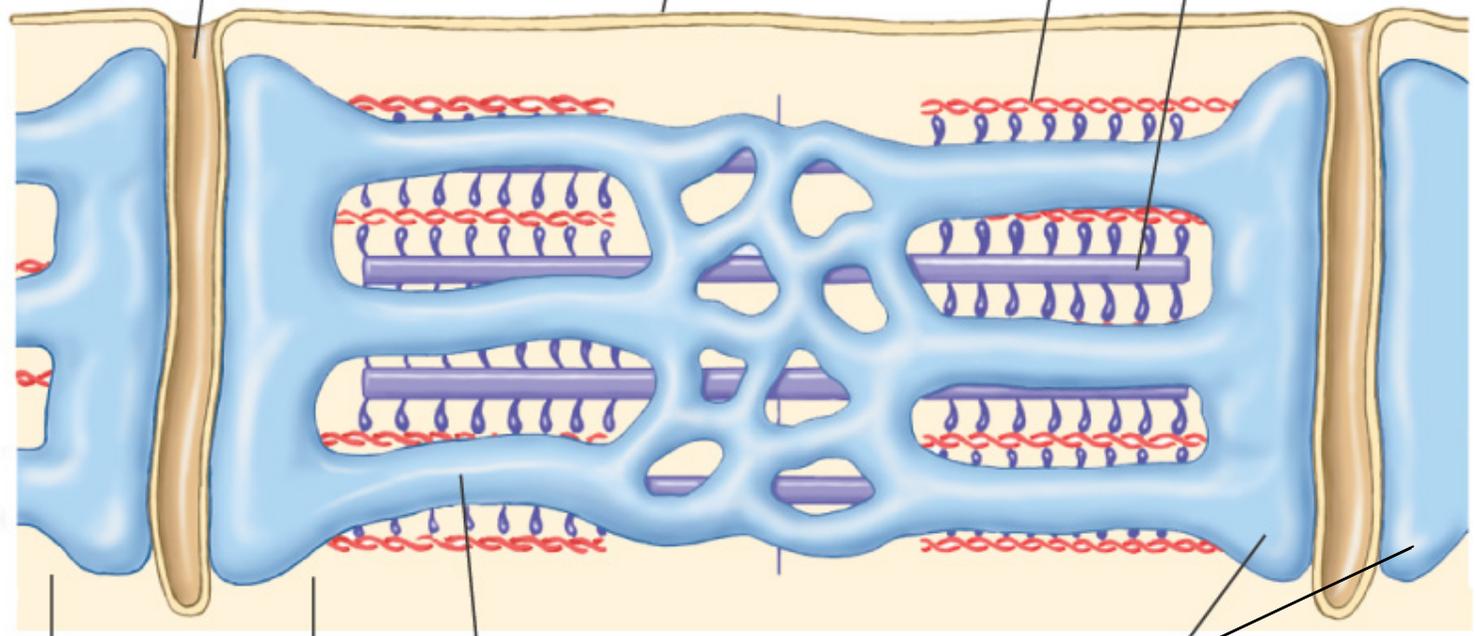

Fig

T-tubule brings action potentials into interior of muscle fiber.

Sarcolemma

Thin filament

Thick filament

Triad

Sarcoplasmic reticulum stores Ca²⁺.

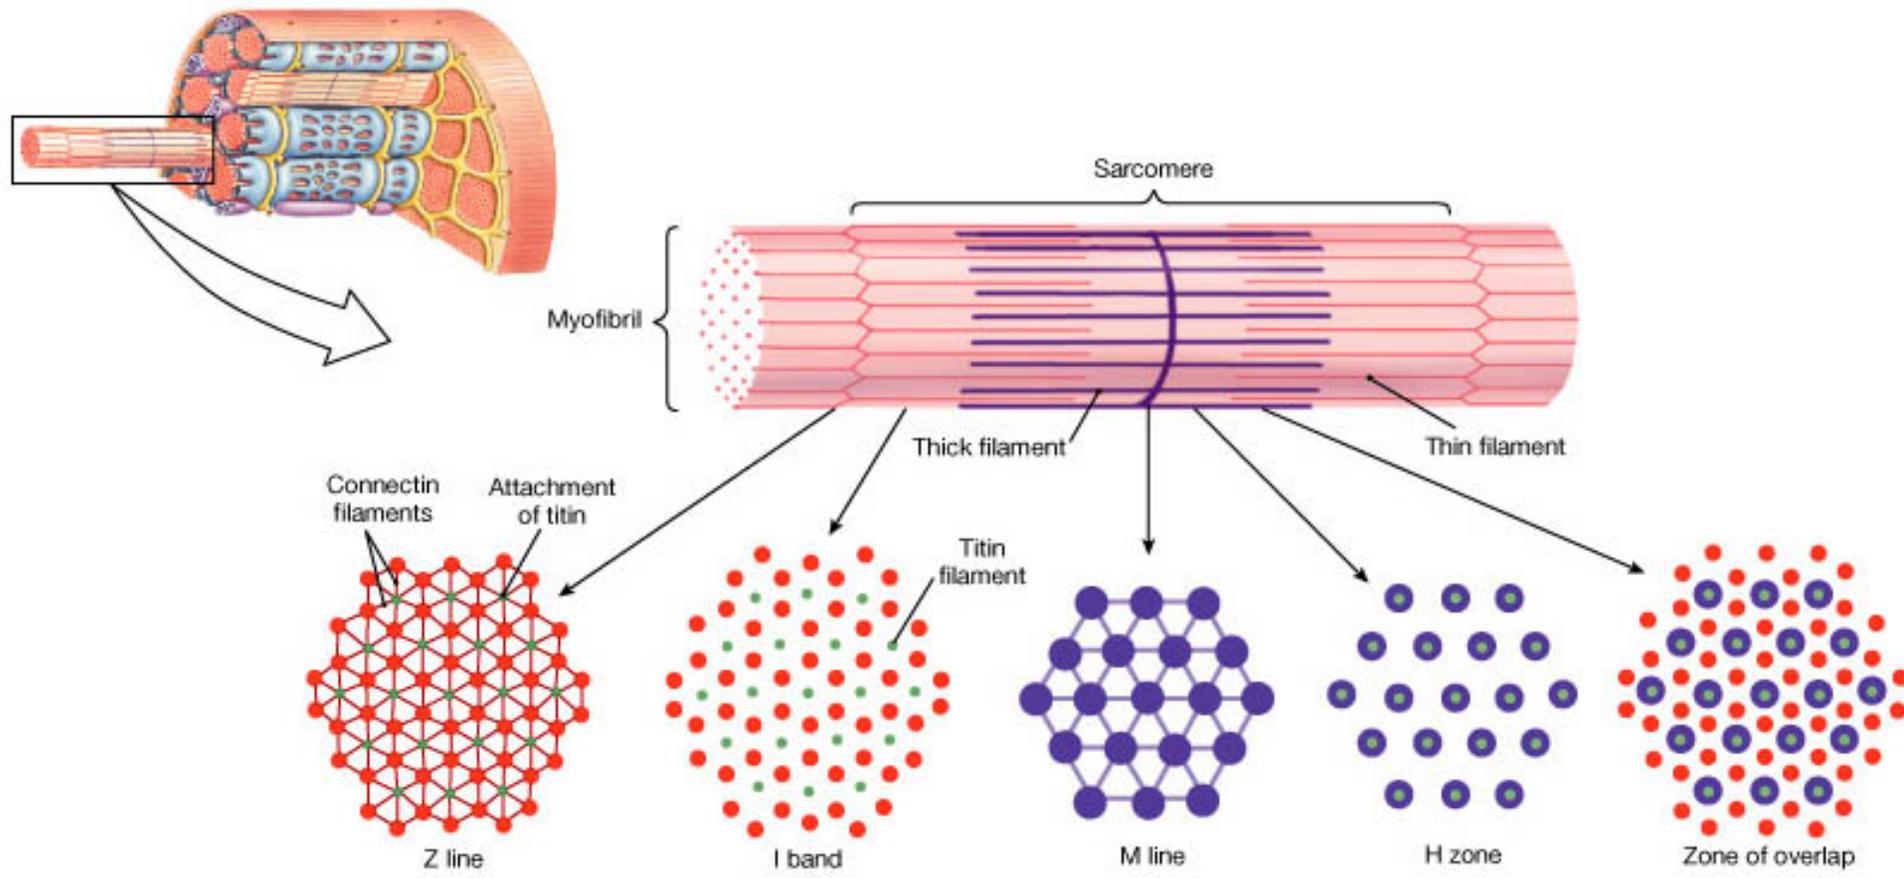

Lateral sacs

Sarcomere

- The functional unit of skeletal muscle
- Sarcomeres are connected in series to make myofibrils
- ~10,000 of sarcomeres make a myofibril
- Each sarcomere contracts shortening the length of the entire myofibril

(a) Organization of thick and thin filaments

Fig
9.4

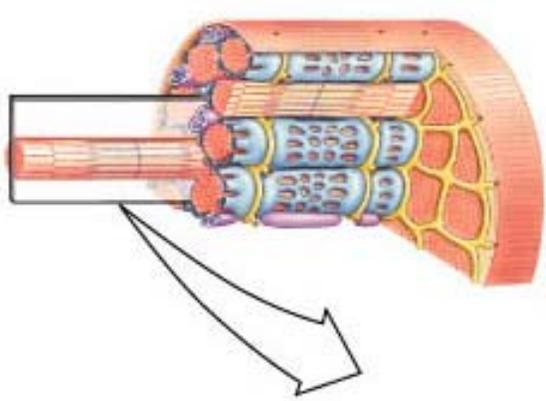

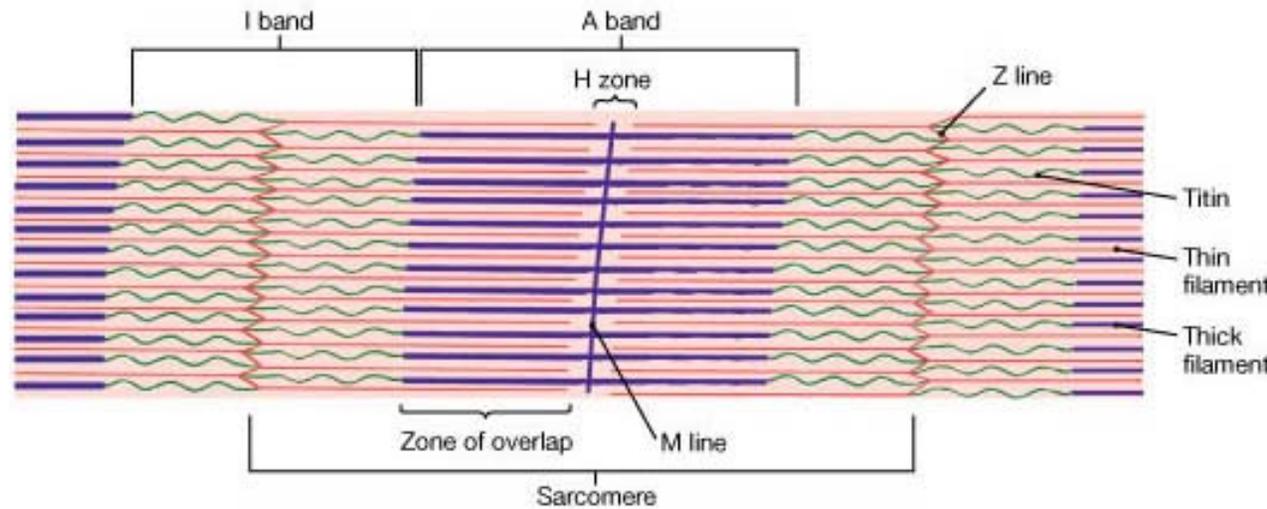

Fig
9.4

(b) Sarcomere in longitudinal section

I-band= light band=contains actin=thin filament

A-band=dark band=contains myosin=thick filament

Z-line/disc=the ends of the sarcomere=actin connects to the z-bands

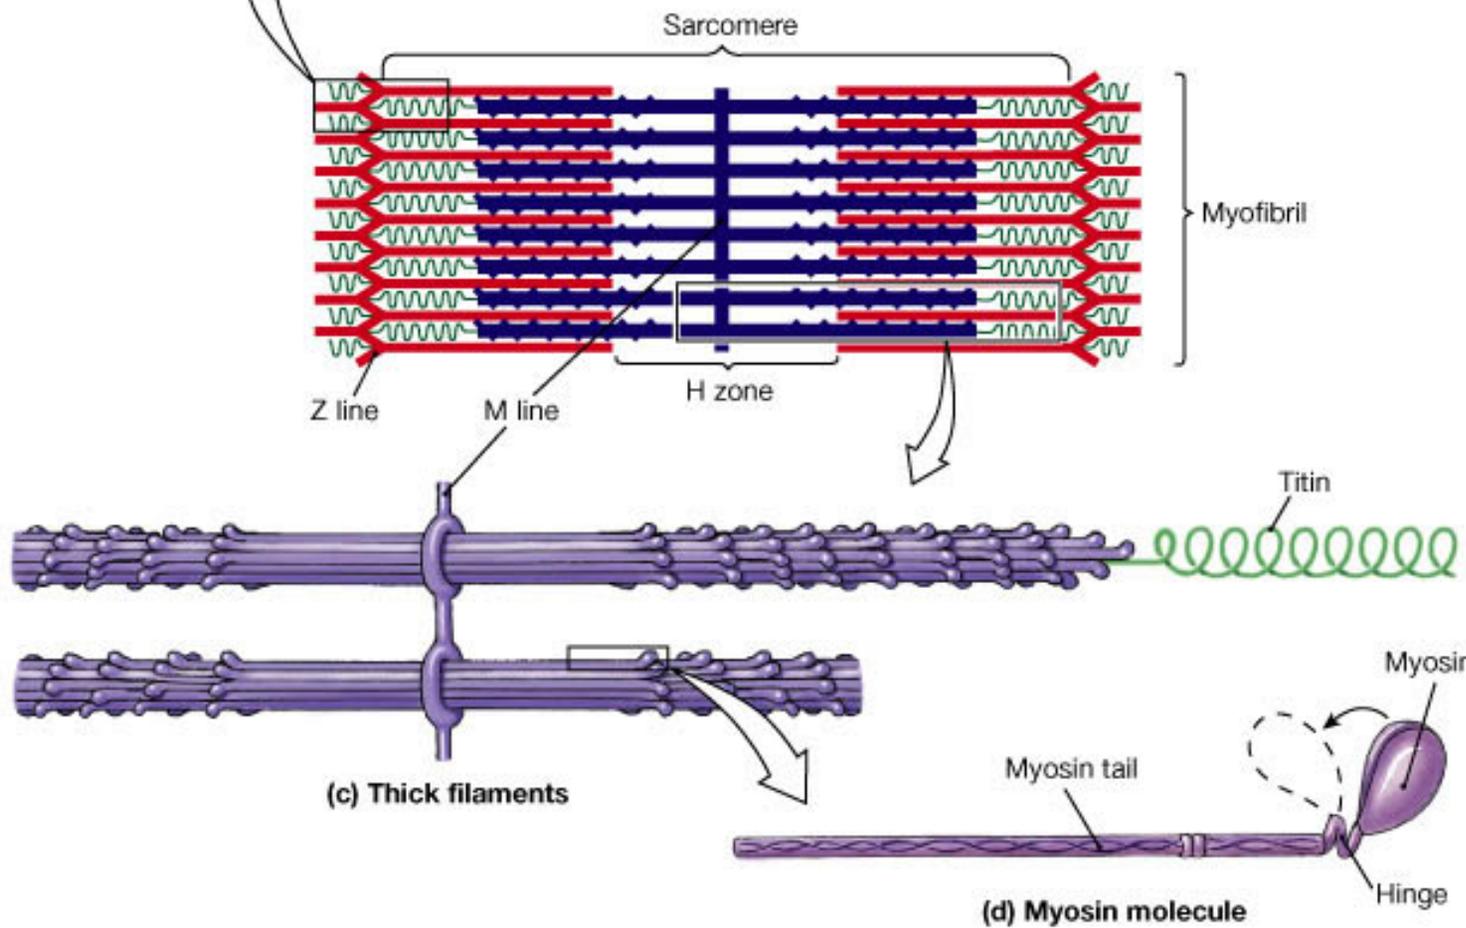

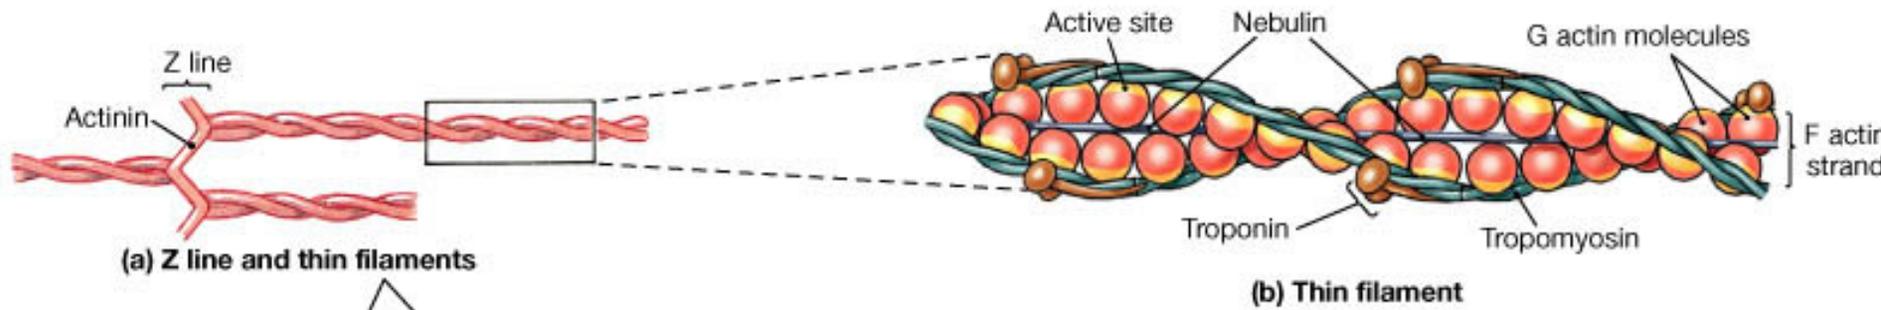

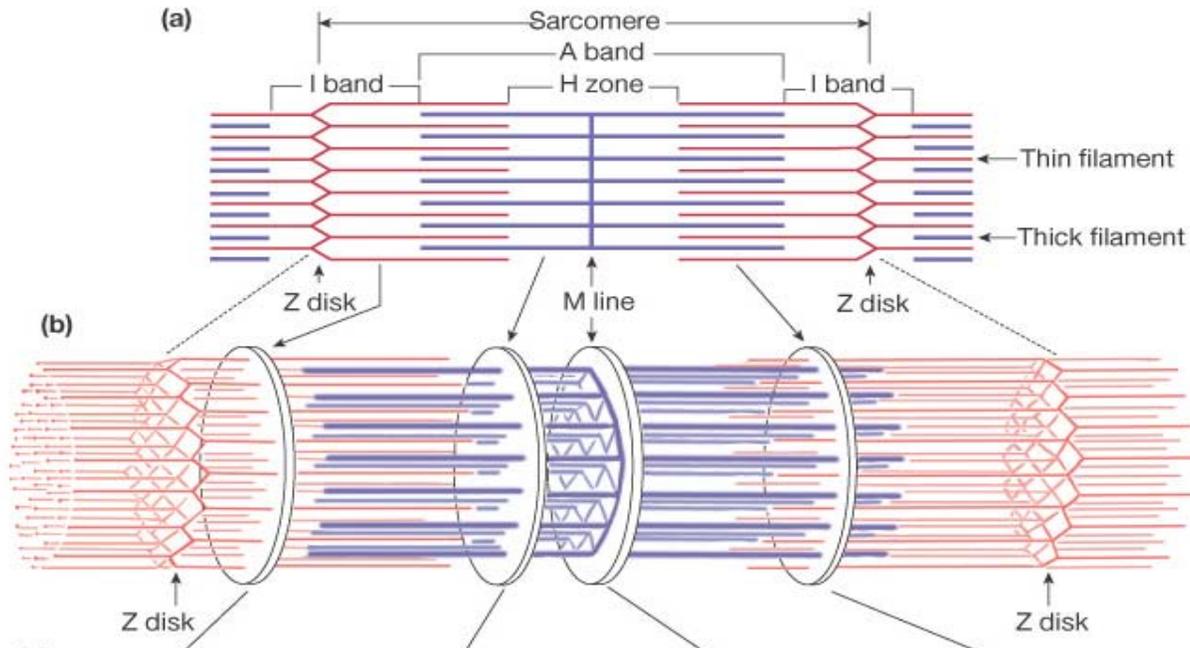

Fig
9.6

Structures of the Sarcomere

Z disks
H-band
I-band
A-band
M line

H-band = myosin only

I-band = actin only

A-band = all of the myosin

Thin filaments

- Contains actin, tropomyosin, and troponin
- Tropomyosin blocks the active site on actin
- Troponin holds tropomyosin in place
- Calcium binds to troponin causing dissociation of the troponin-tropomyosin complex

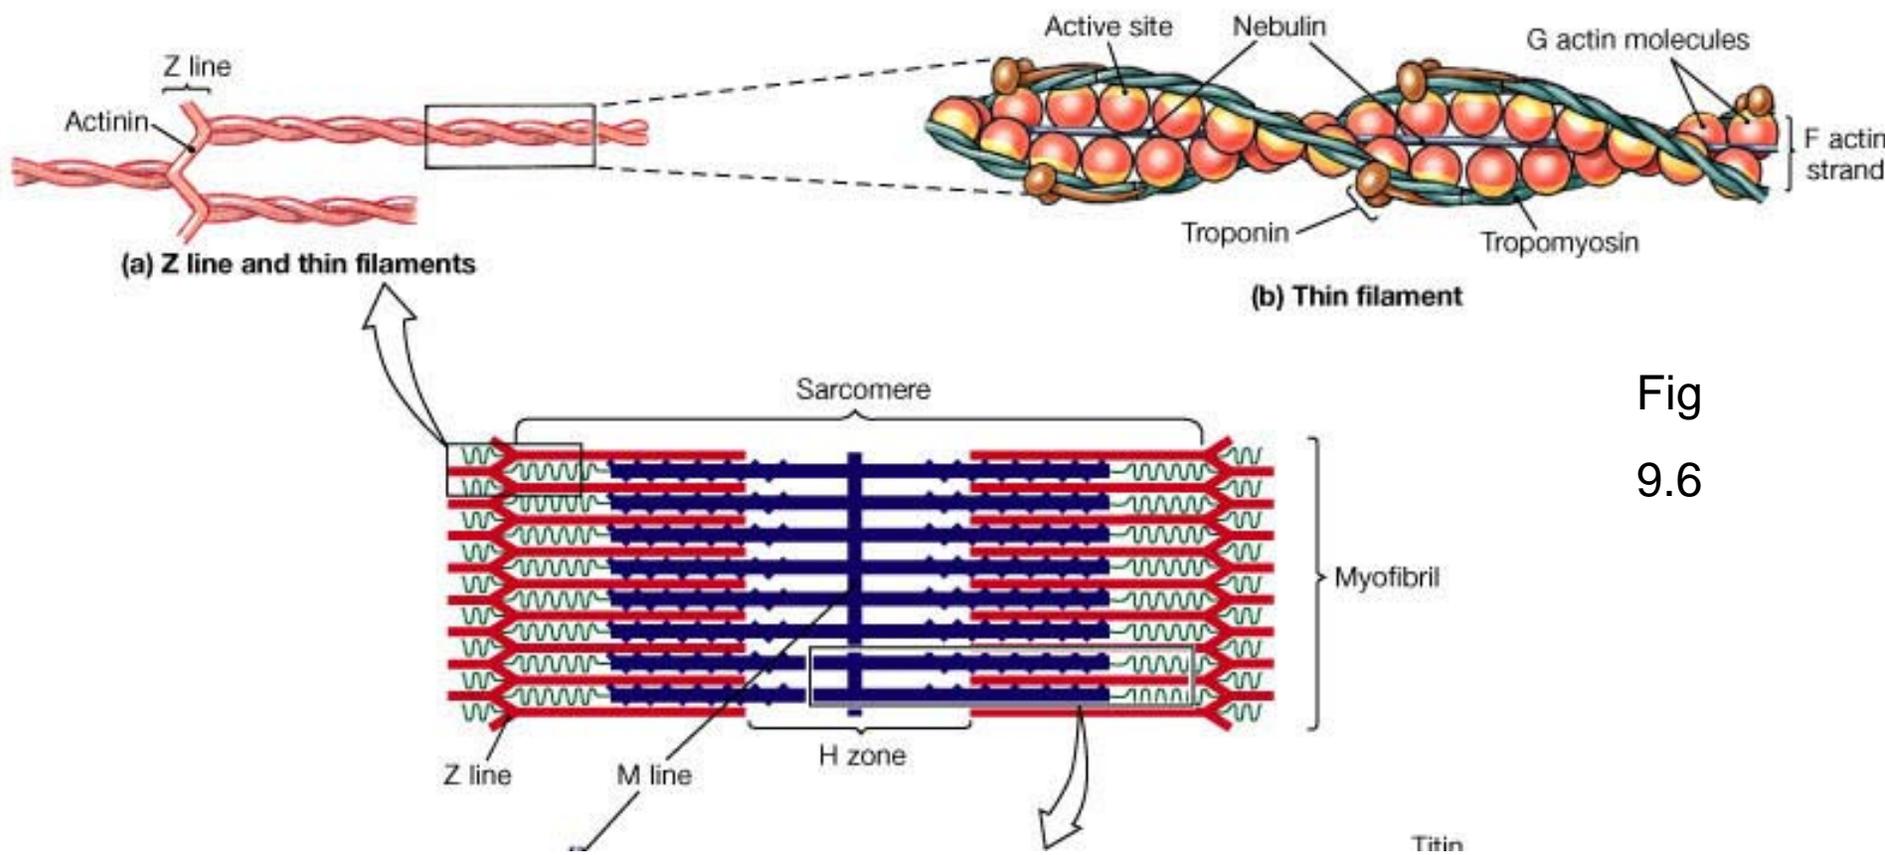

Fig
9.6

Thick filament

- Contain bundles of myosin molecules
- The tail of myosin is attached to the center of the sarcomere, M-line
- The head of myosin attaches to actin if Ca is present in the sarcoplasm

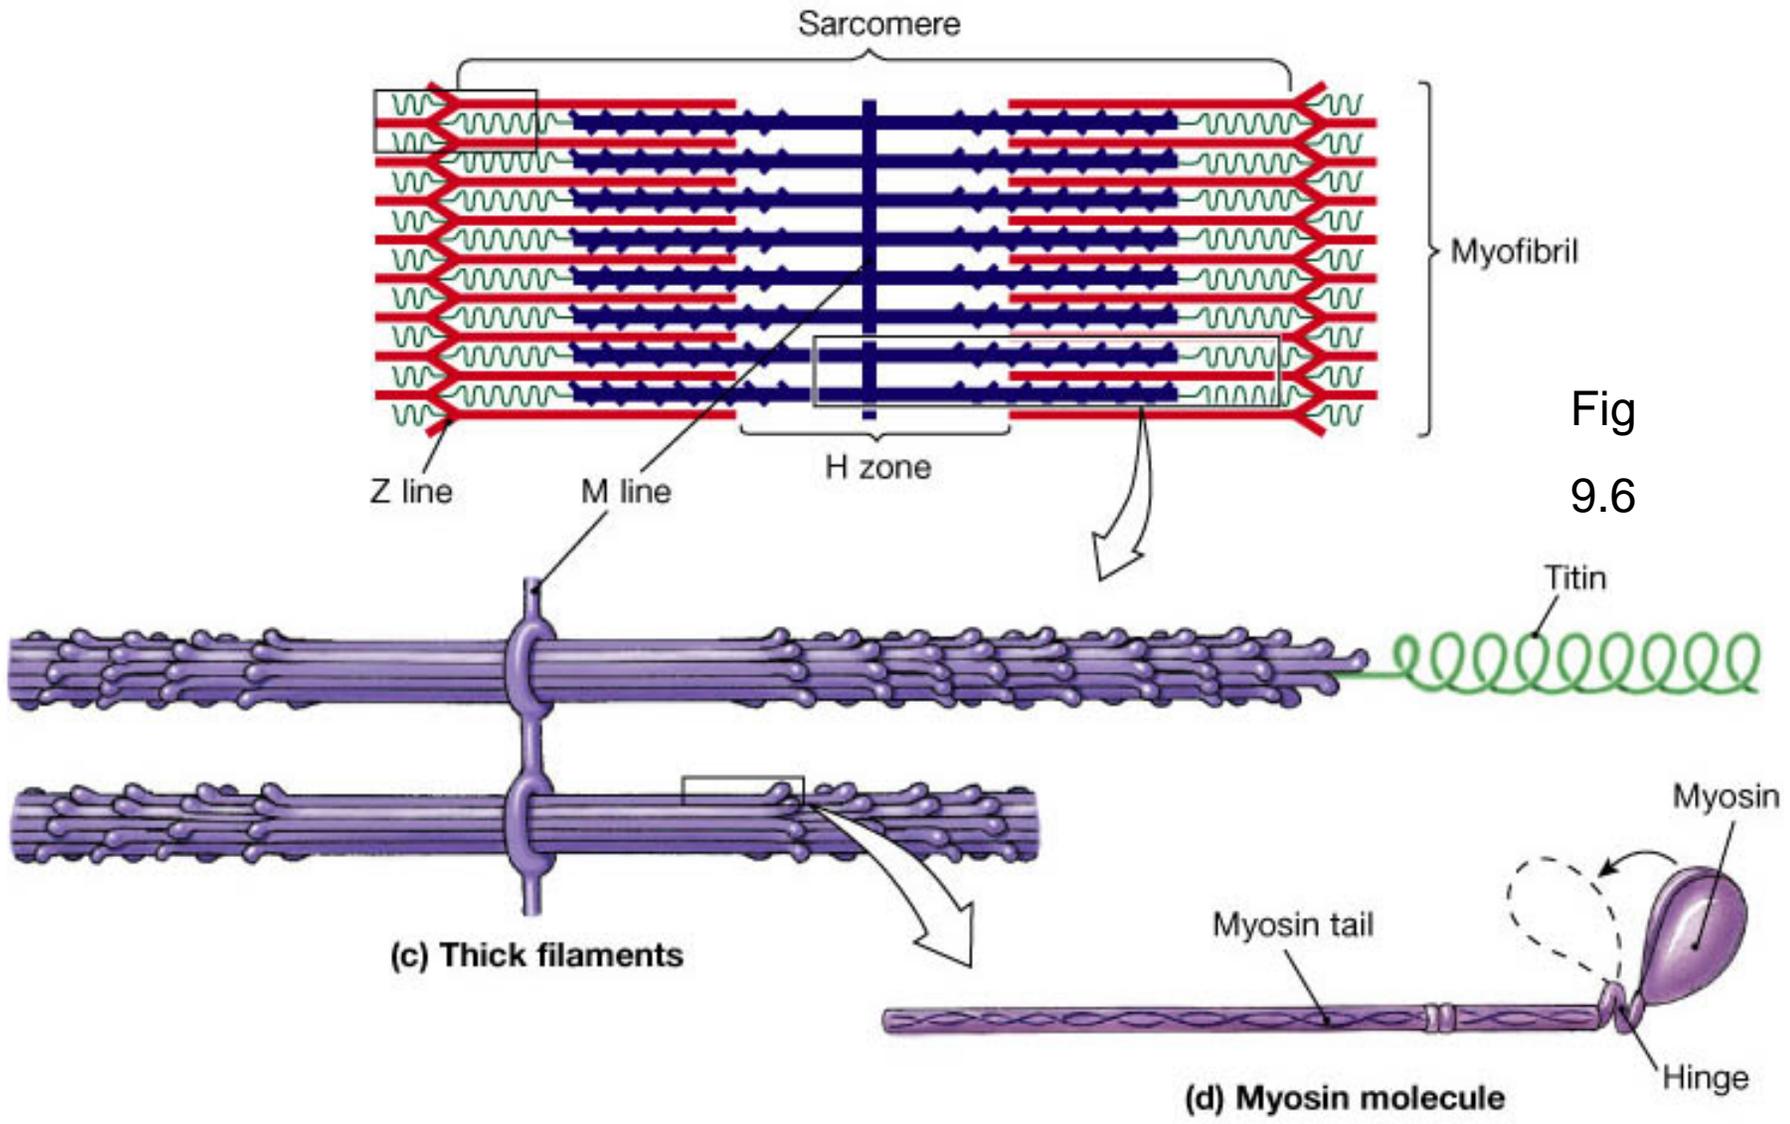

Fig
9.6

Sliding filament theory

- When a skeletal muscle contracts:
 - The I-bands get shorter
 - The z-lines move closer together
 - The myofilaments (actin & myosin) stay the same length
 - The two myofilaments move along side of each other

- Myosin attaches to actin
- Actin is pulled closer to the center of the muscle cell
- Actin is connected to the z lines
- The z lines are pulled closer together

Motor neuron
release
neurotransmitter
ACh

Changes in
sarcolemma
permeability to
ions

Generation of
electrical impulse
called an action
potential

Excitation - Contraction in Skeletal Muscle

- 1 Somatic motor neuron releases ACh at neuromuscular junction.
- 2 Net entry of Na^+ through ACh receptor-channel initiates a muscle action potential.

Intracellular Ca^{2+} triggers contraction

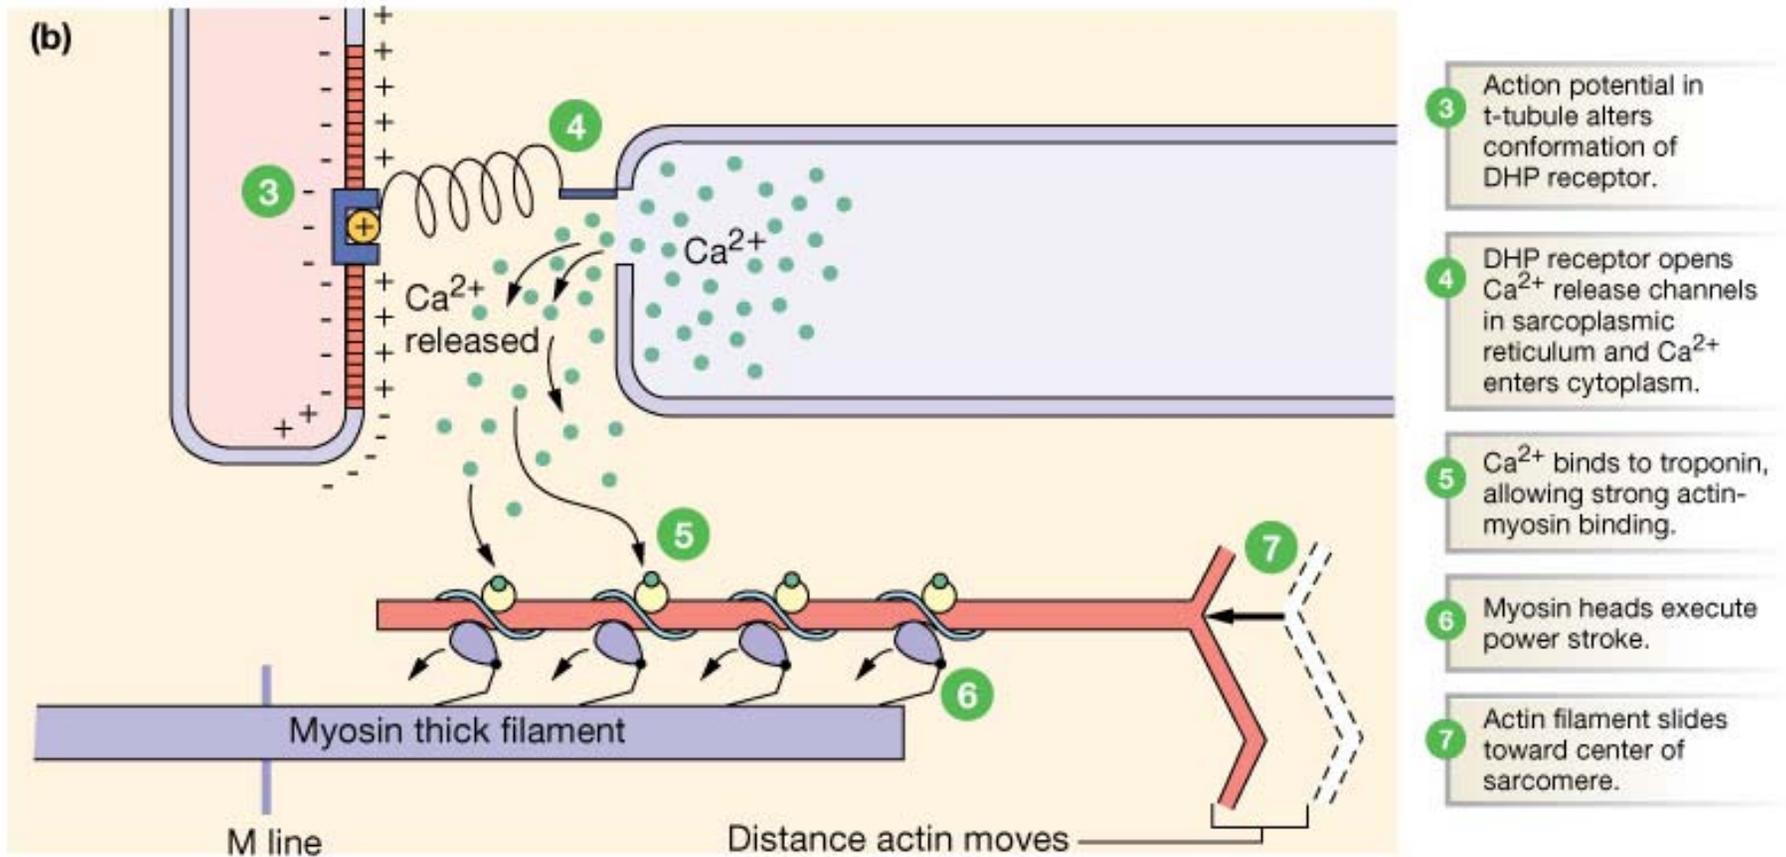

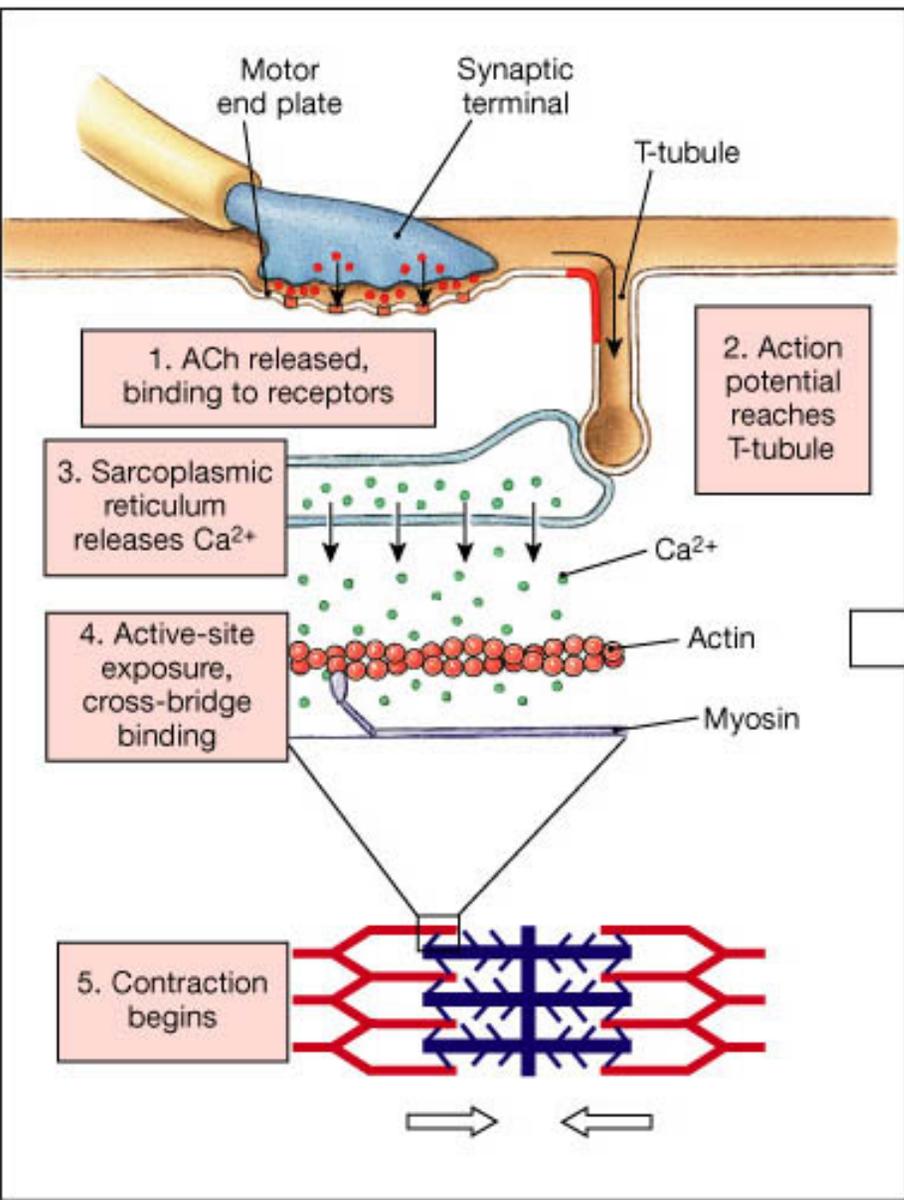

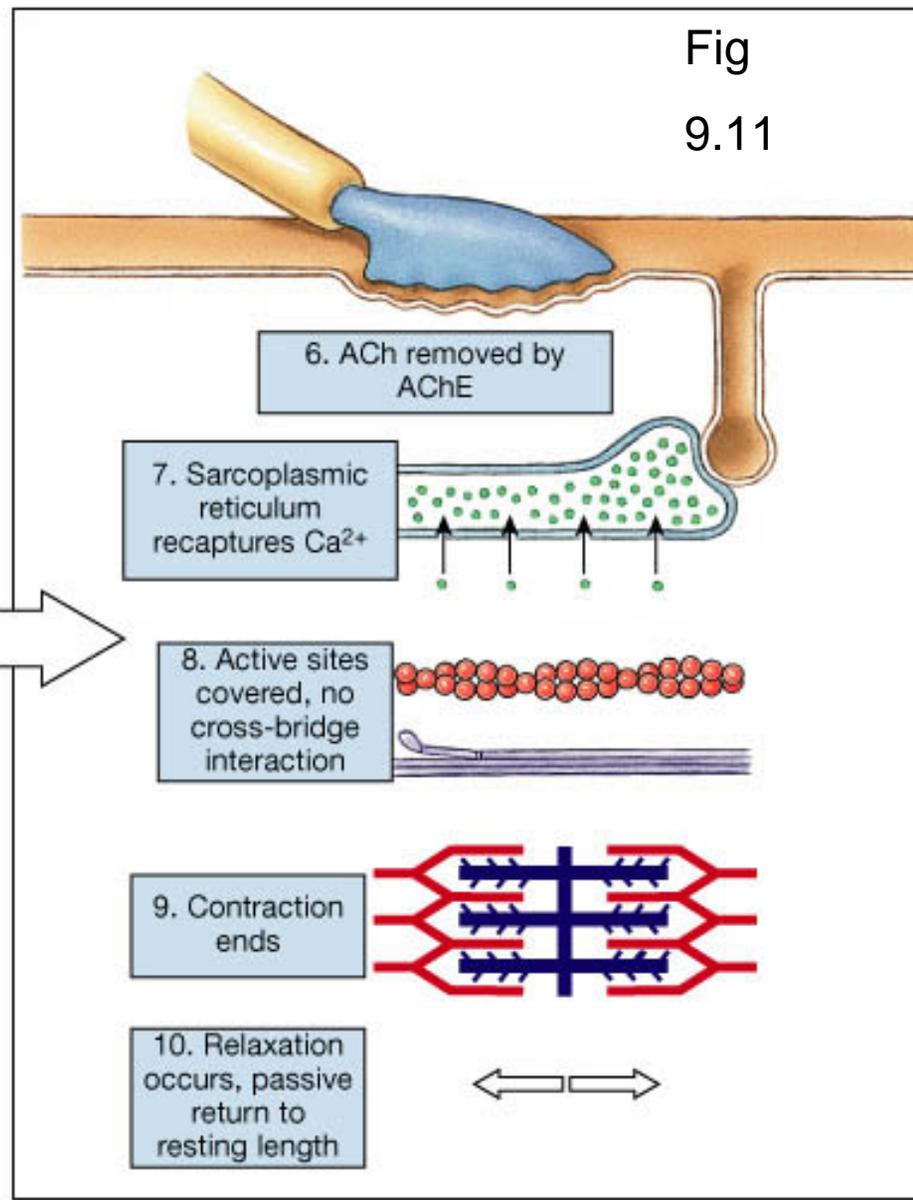

Fig
9.11

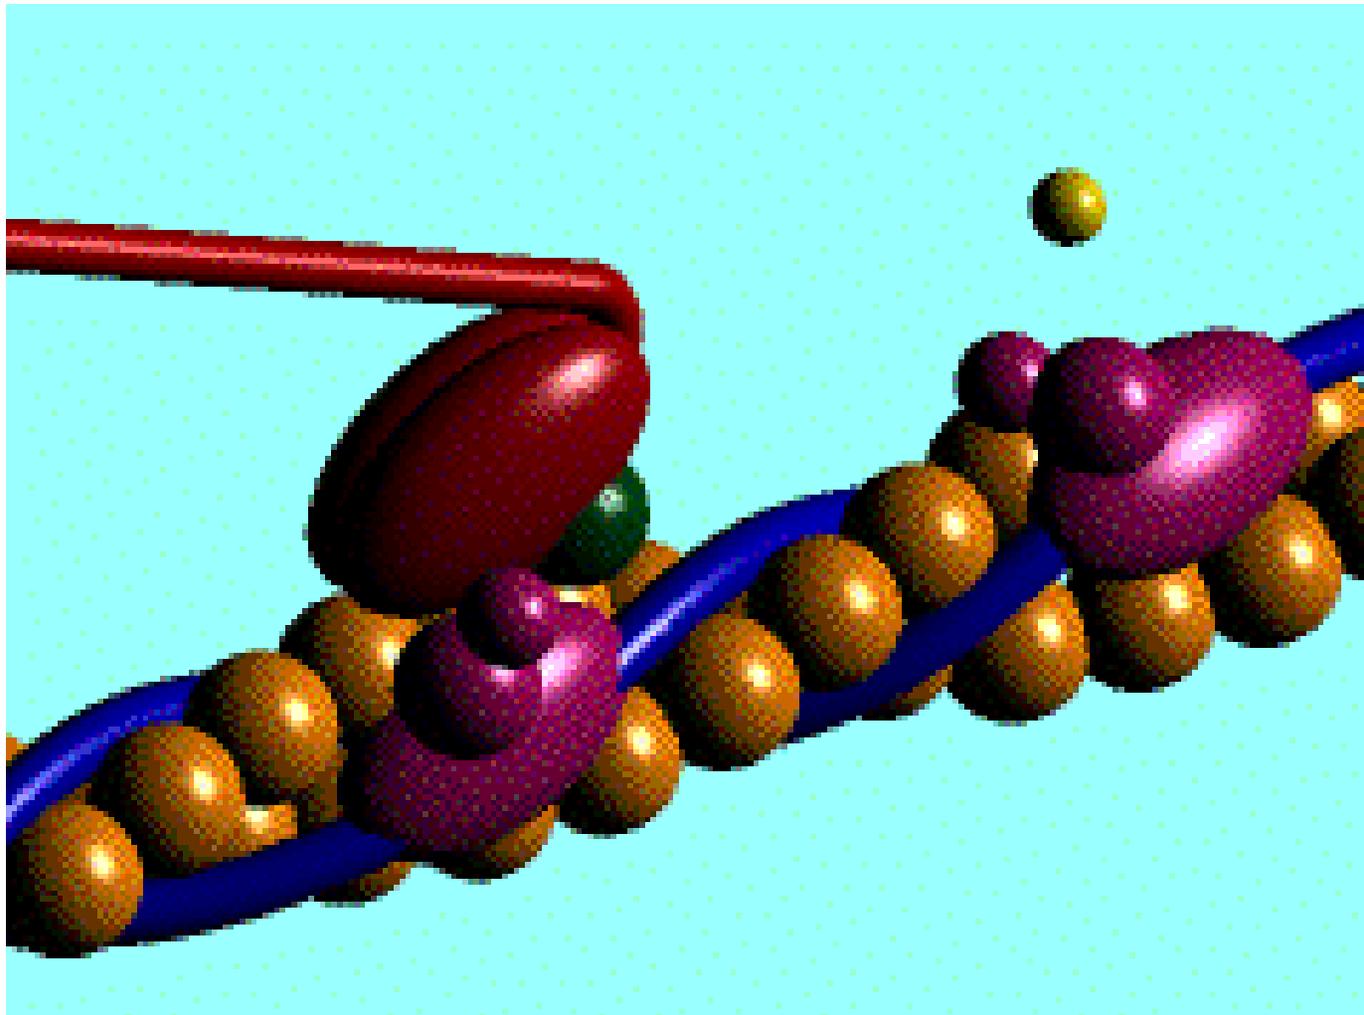

Steps in the initiation of a contraction

Steps that end the contraction

Sliding filament theory

- Contraction-myosin binds to actin pulling it towards the M line

Myosin

Actin

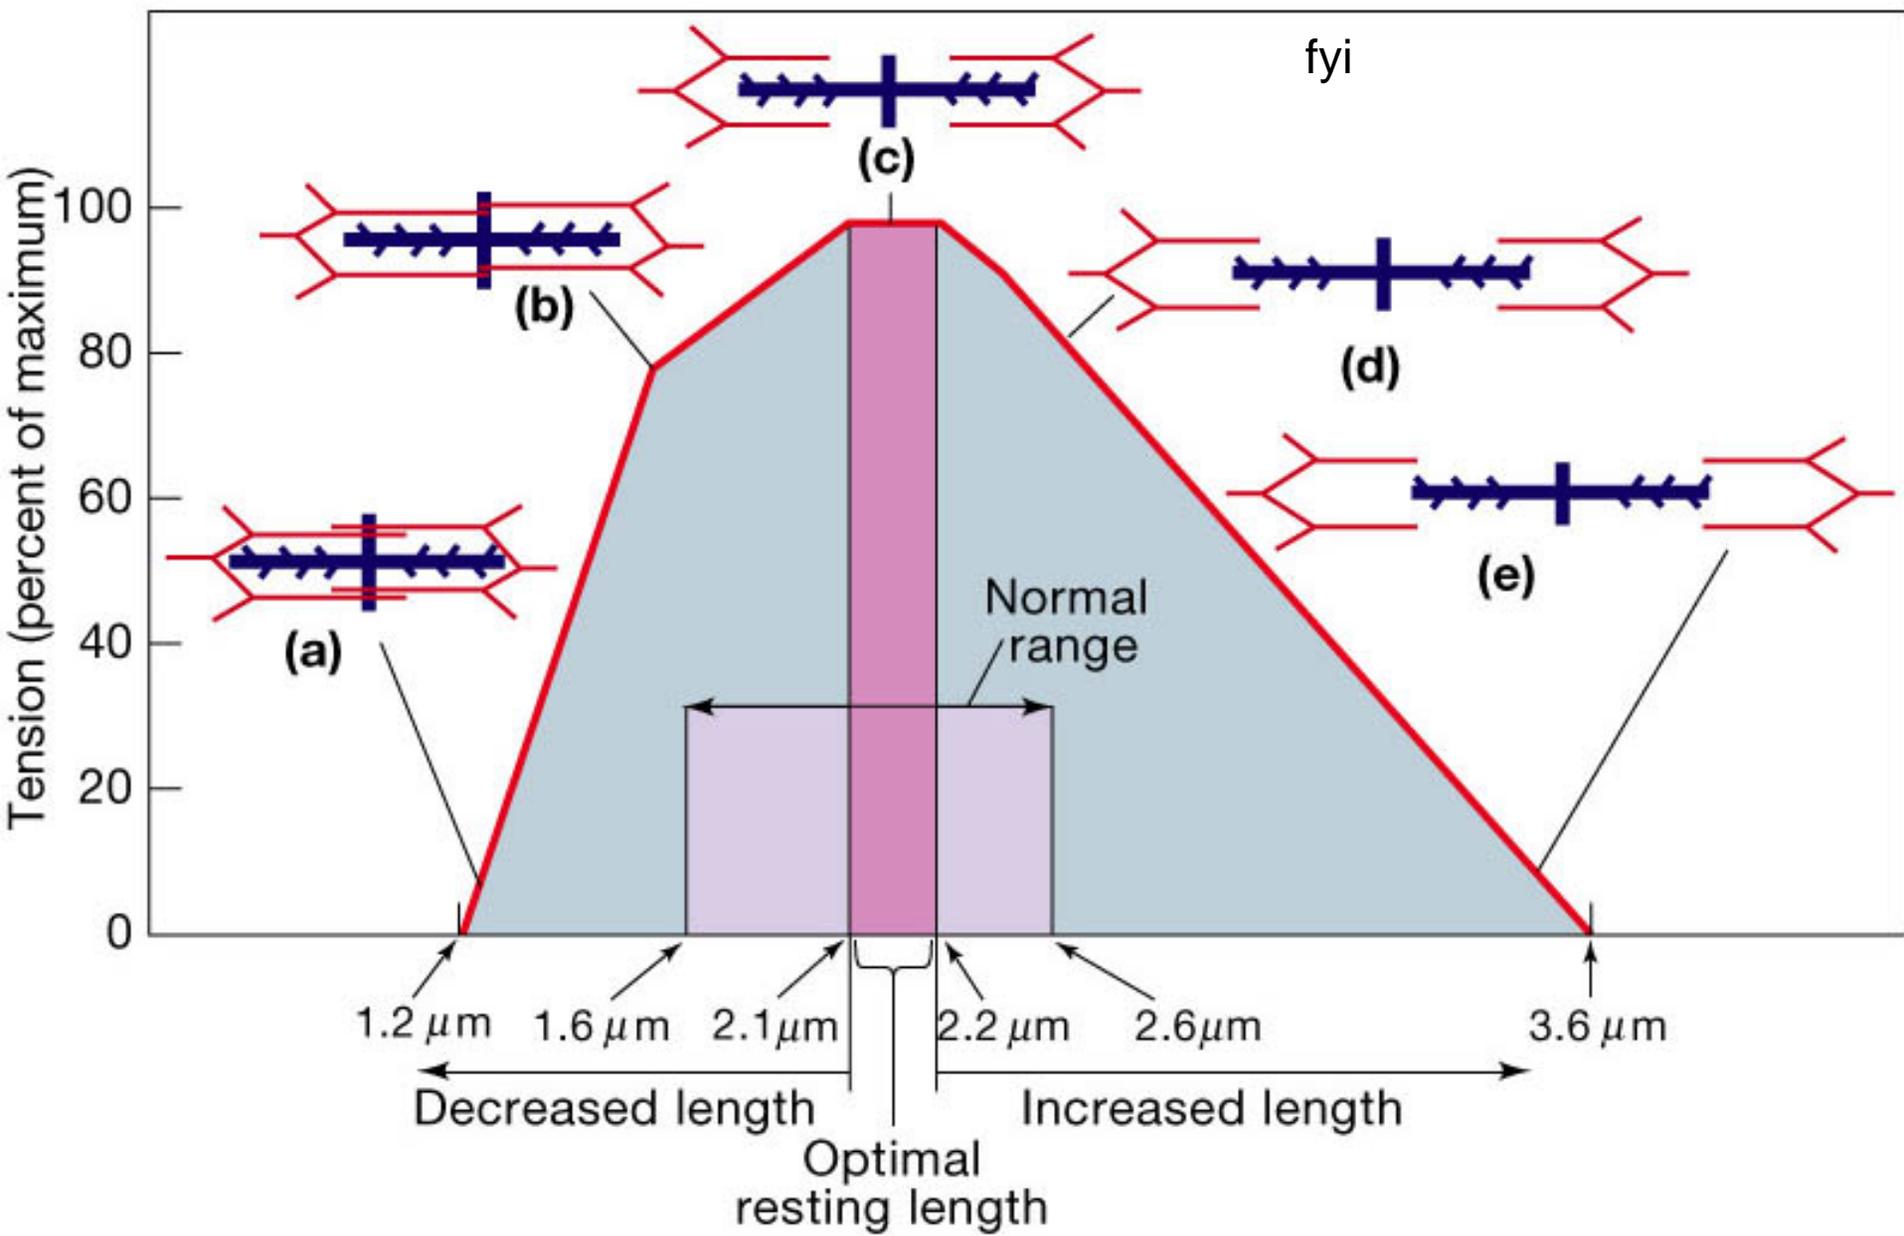

Troponin

Tropomyosin

ATP

Ca²⁺

Mg²⁺

Connective tissue of muscle

- Epimysium-surrounds the entire muscle
- Perimysium-surrounds fascicles
- Fascicle-a bundle of muscle cells
- Endomysium-surrounds individual muscle cells
- Epimysium & perimysium are attachment sites for nerves & blood vessels

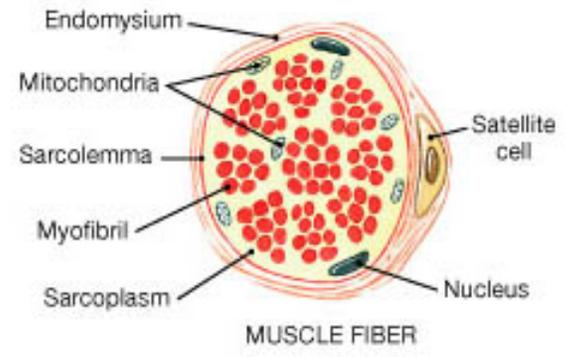

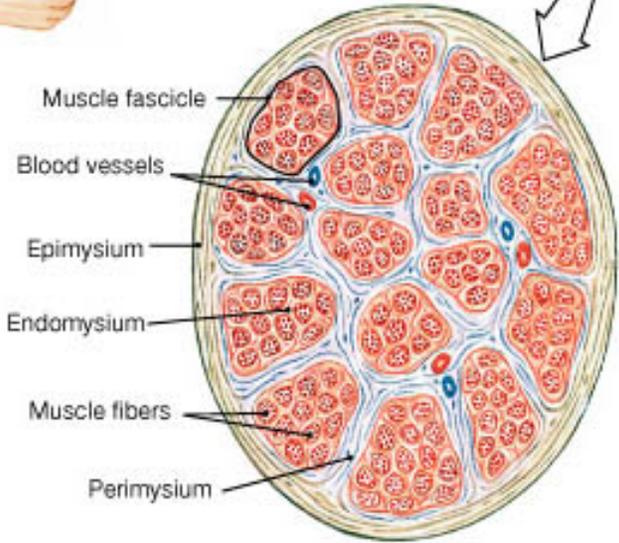

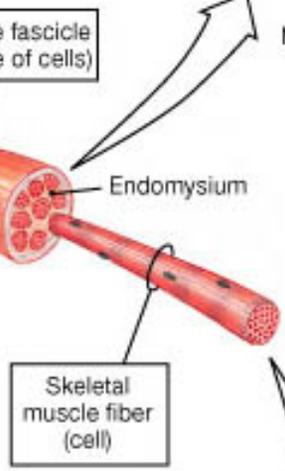

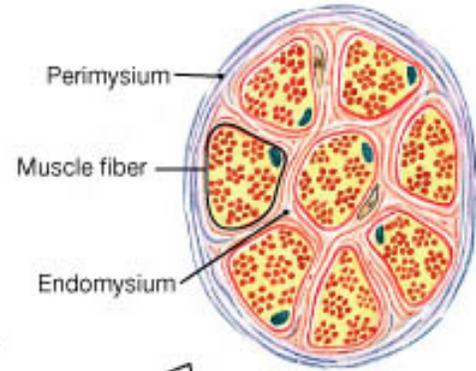

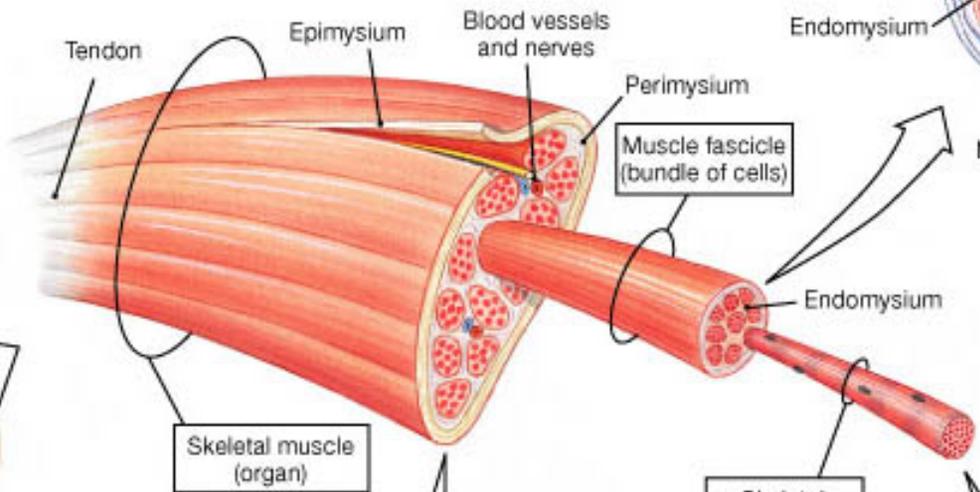

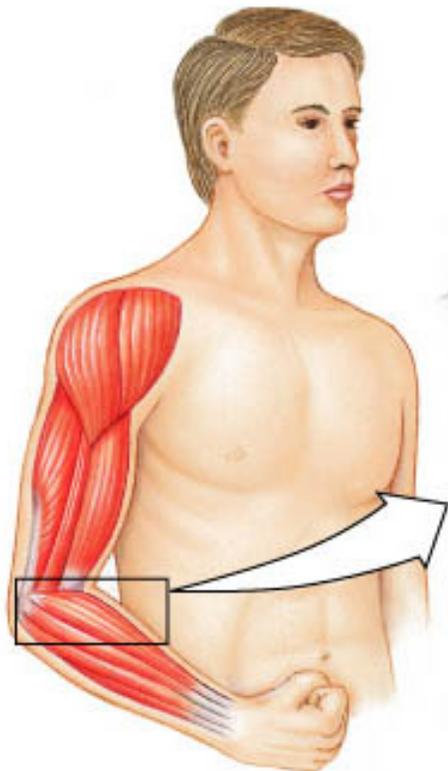

Fig 9.1

(d) MYOFIBRIL

Surrounded by:
Sarcoplasmic
reticulum

Consists of:
Sarcomeres
(Z line to Z line)

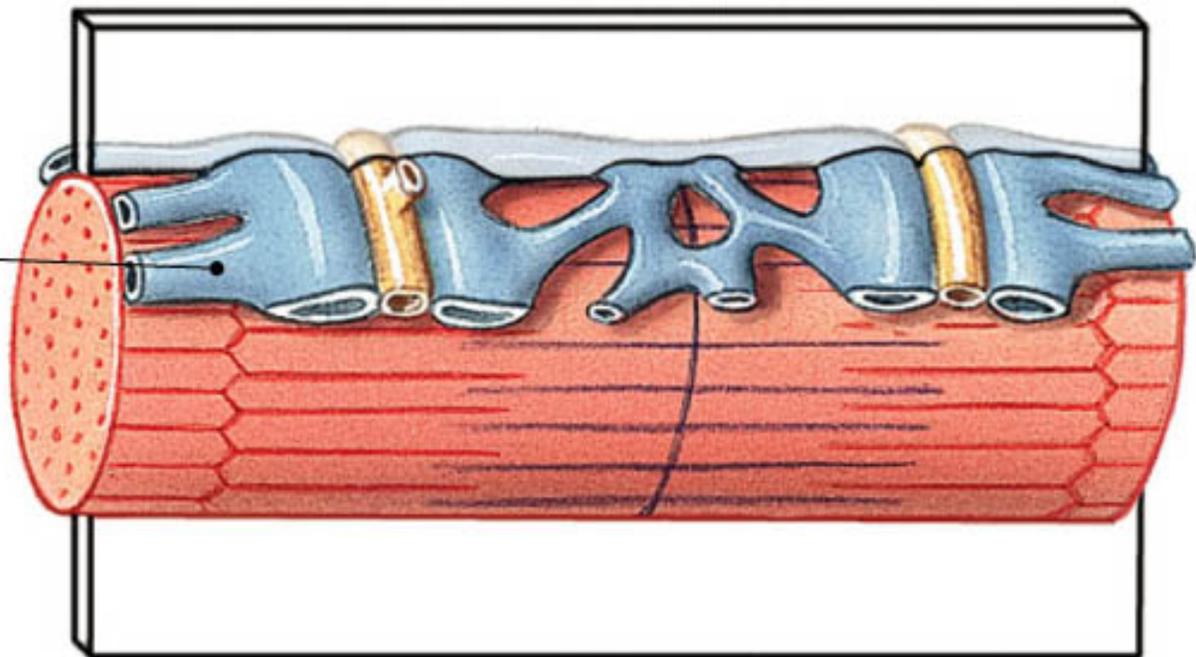

Fig
9.5

(c) MUSCLE FIBER

Surrounded by:
Endomysium

Contains:
Myofibrils

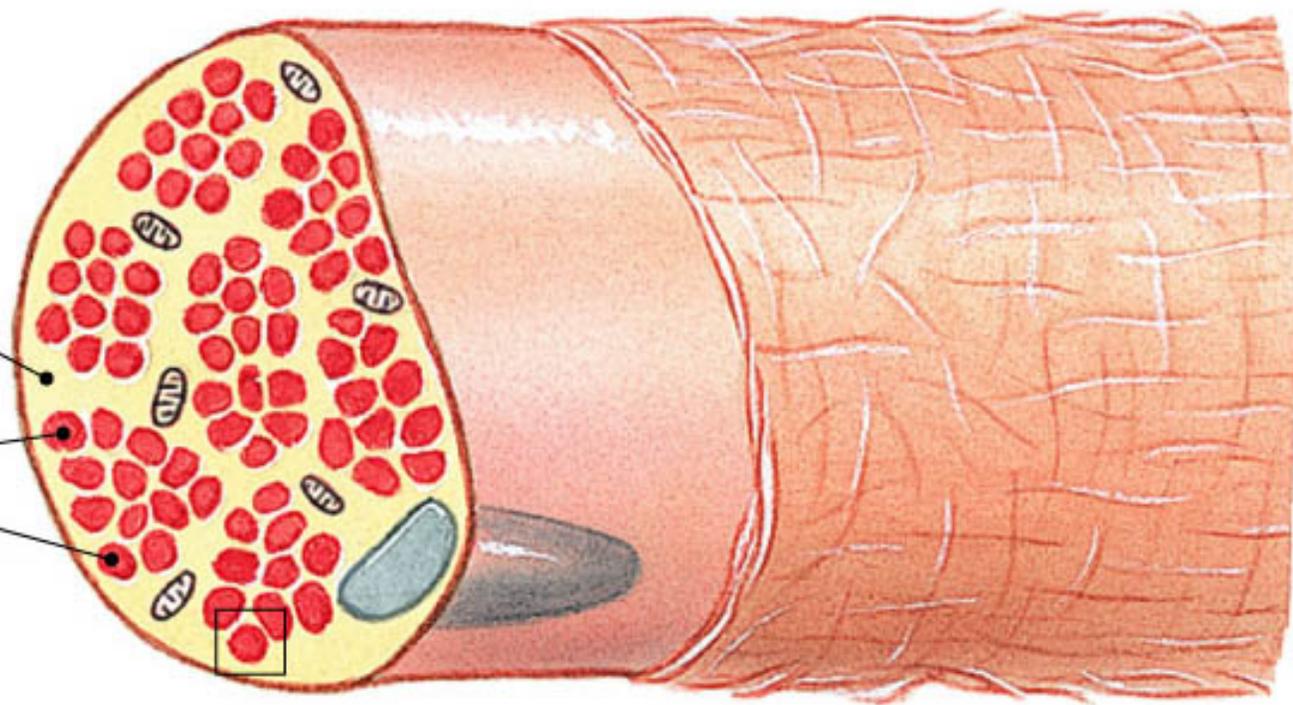

Fig
9.5

(b) MUSCLE FASCICLE

Surrounded by:
Perimysium

Contains:
Muscle fibers

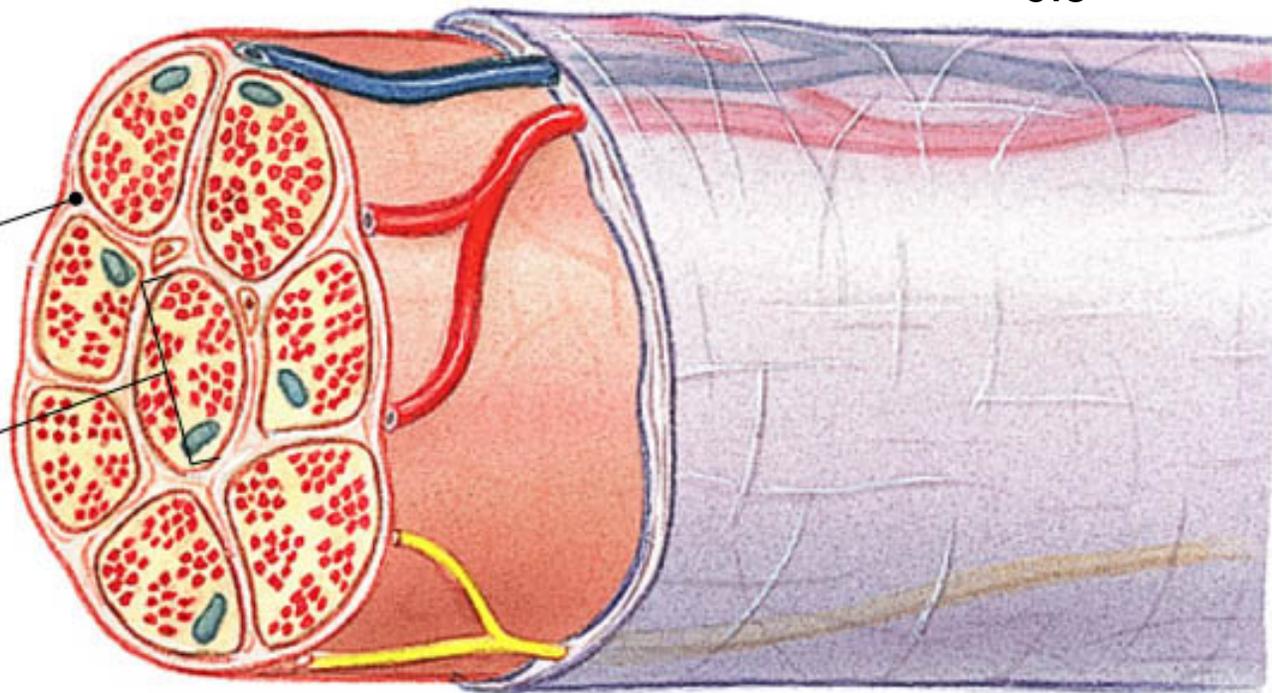

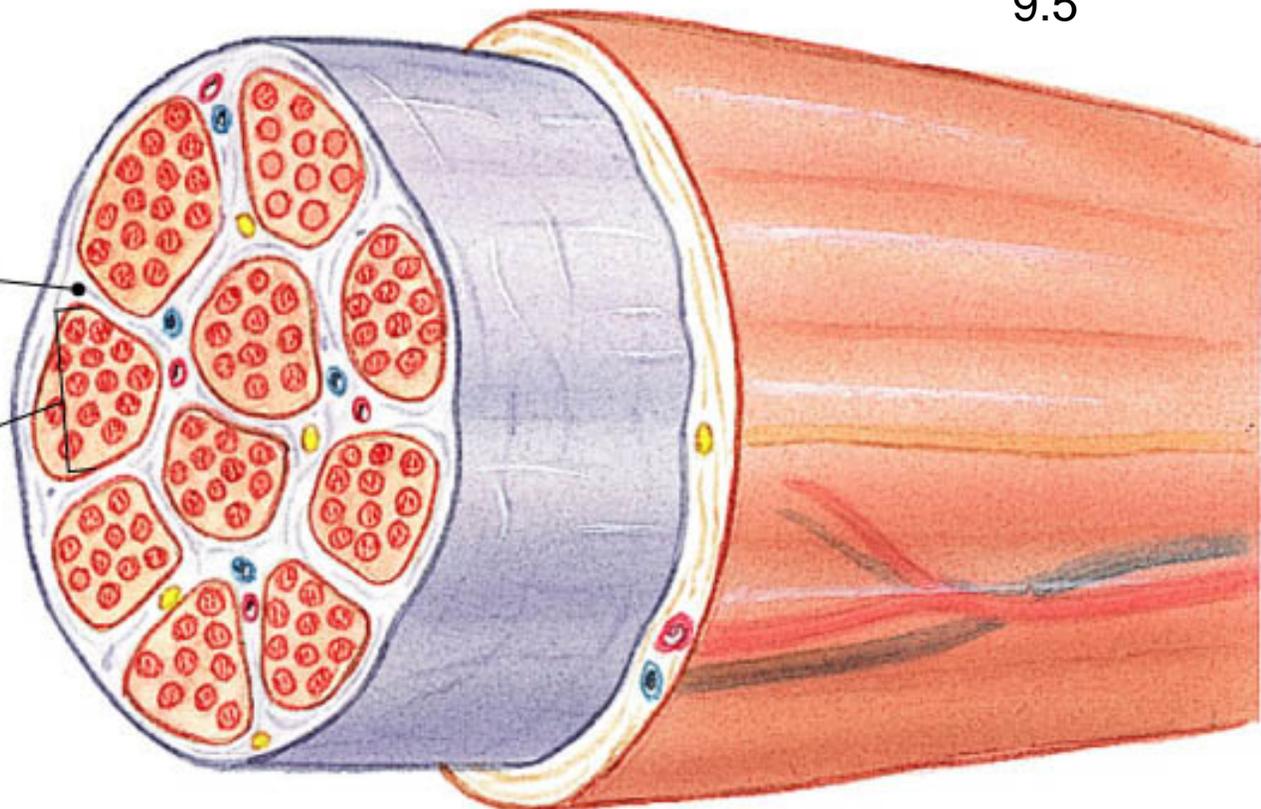

Fig
9.5

(a) SKELETAL MUSCLE

Surrounded by:
Epimysium

Contains:
Muscle fascicles

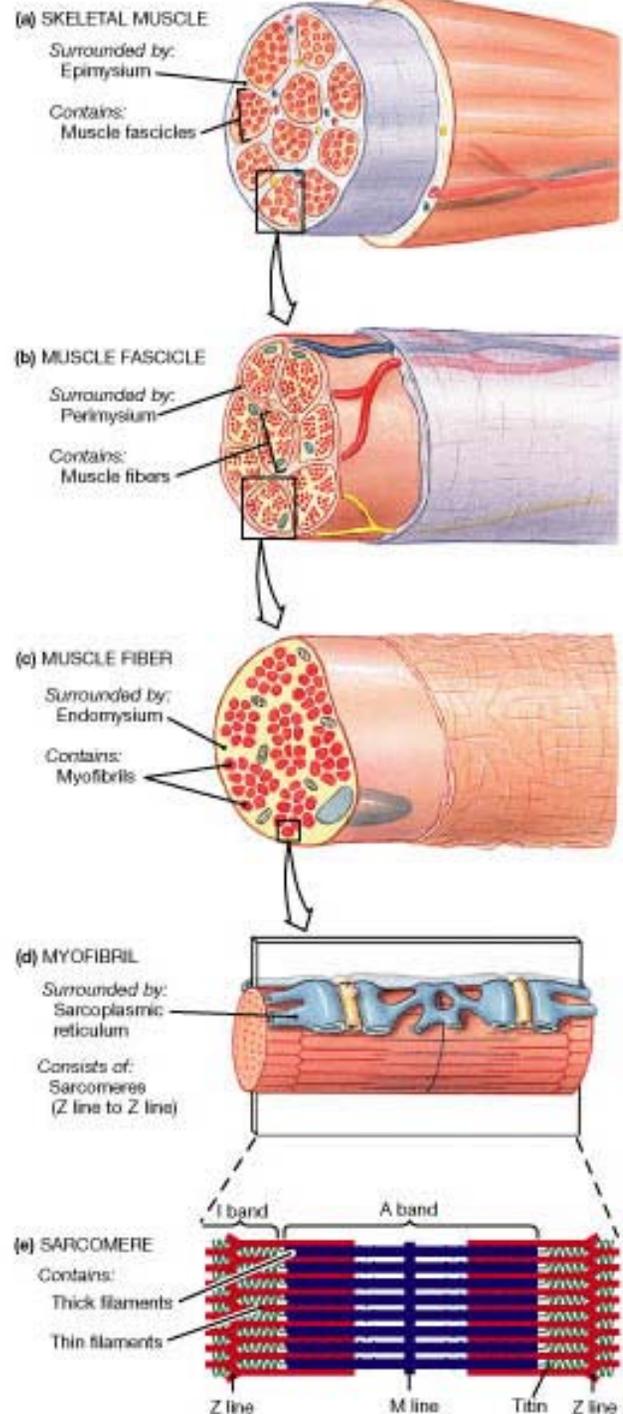

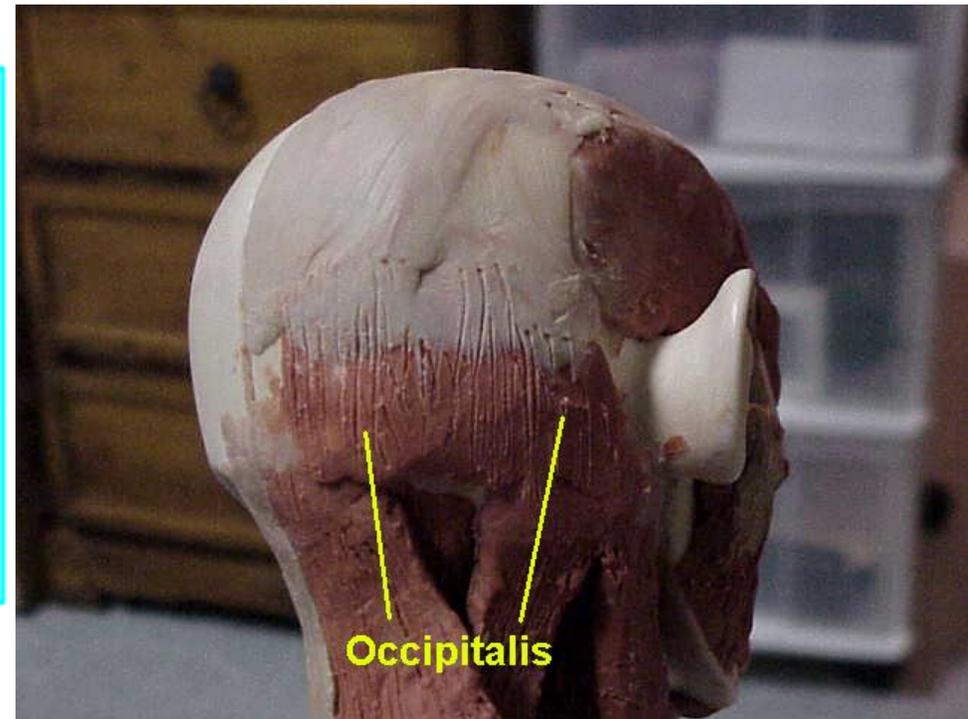

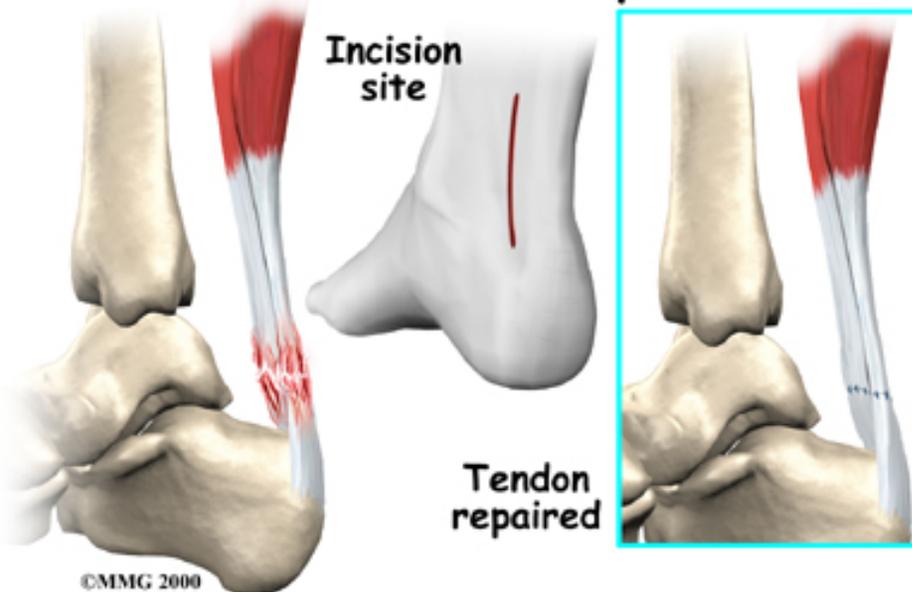

Fig
9.5

Tendons & aponeuroses

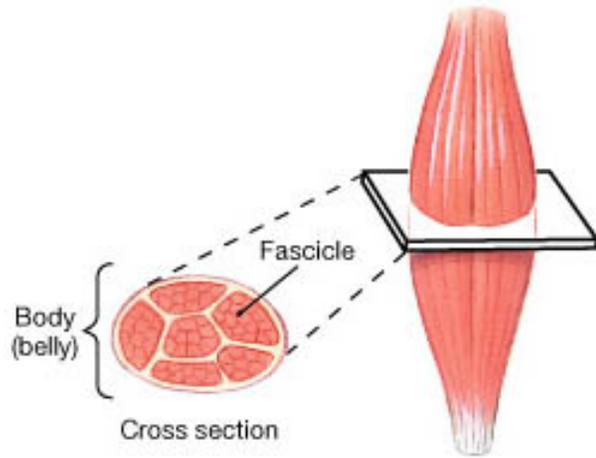

- Tendons attach skeletal muscle to bone, skin, or another muscle
- Aponeuroses-a wide flat tendon

Repair of
Achilles Tendon Rupture

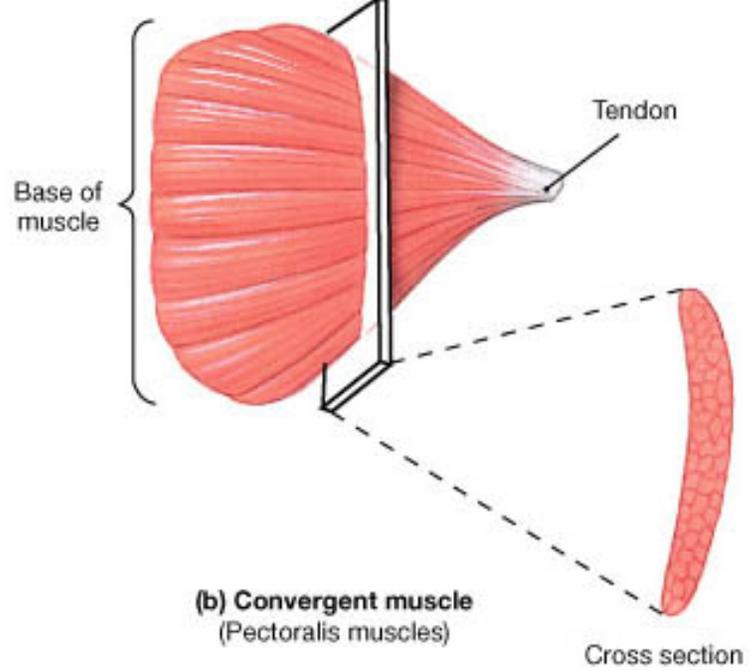

Organization of muscle fibers

- Muscle fascicles are organized six different ways:
- Parallel-parallel to the long axis of the muscle
- Convergent-converge from a wide area to a small area
- Circular-concentrically arranged around a opening

(a) Parallel muscle
(Biceps brachii muscle)

(b) Convergent muscle
(Pectoralis muscles)

Fig
9.14

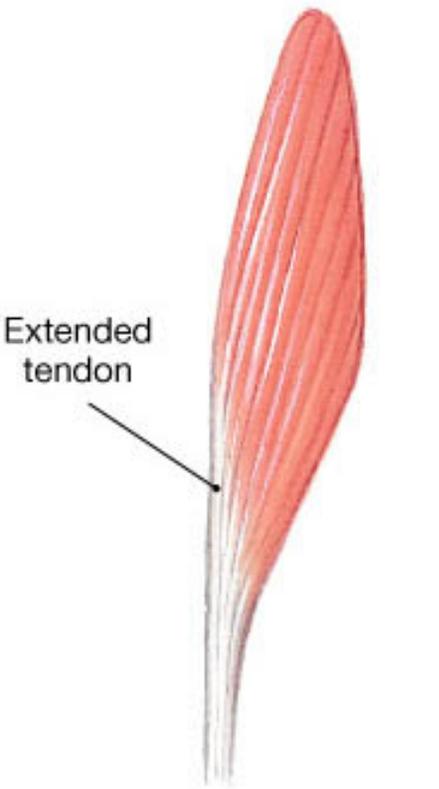

Relaxed

Contracted

(f) Circular muscle
(Orbicularis oris muscle)

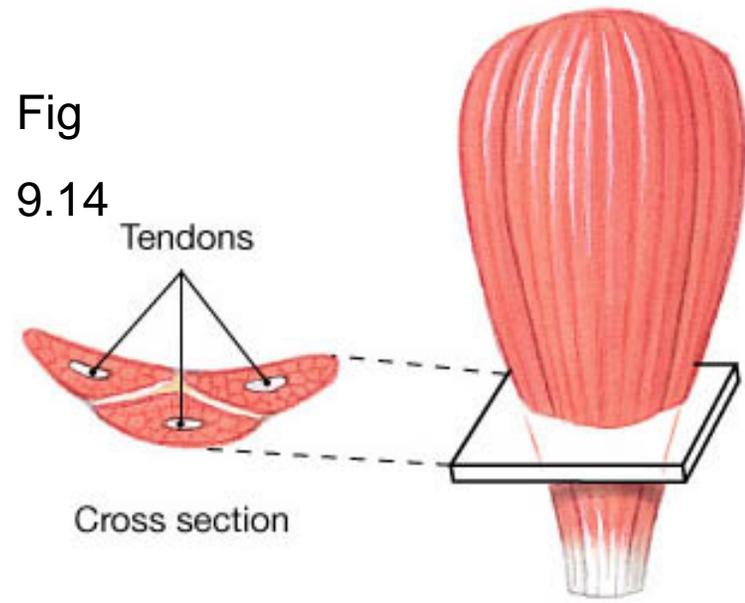

- **Unipennate**-at an angle on one side of the tendon
- **Bipennate**- at an angle on both sides of the tendon
- **Multipennate**-converge from a wide area to a small area. The tendon branches within the muscle

(c) Unipennate muscle
(Extensor digitorum muscle)

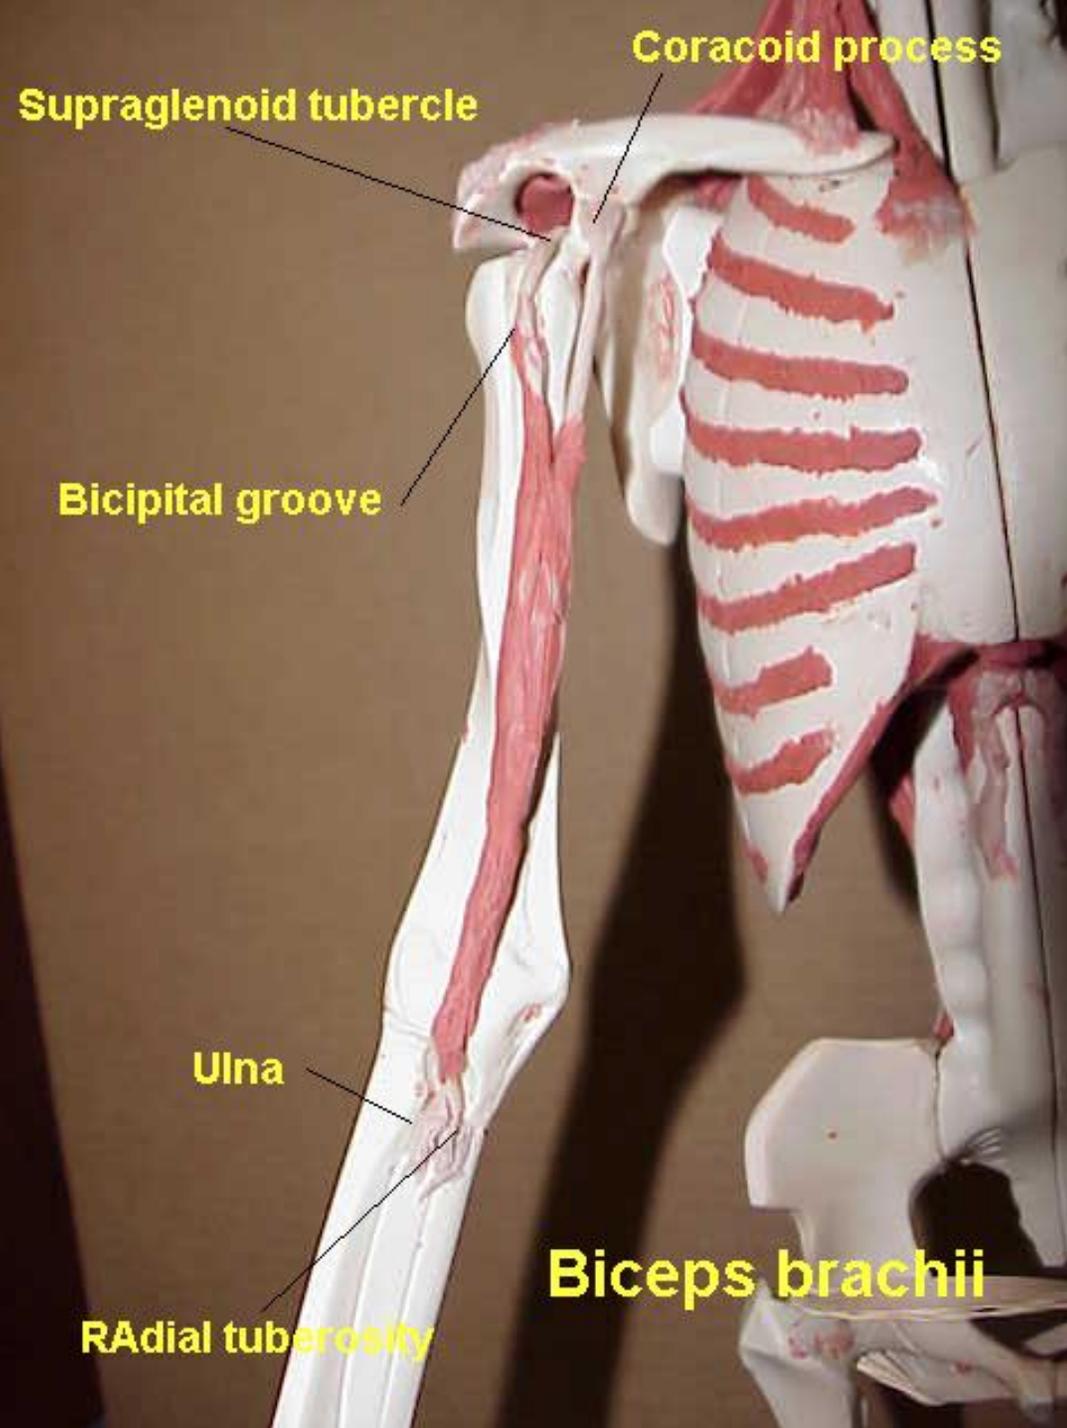

(d) Bipennate muscle
(Rectus femoris muscle)

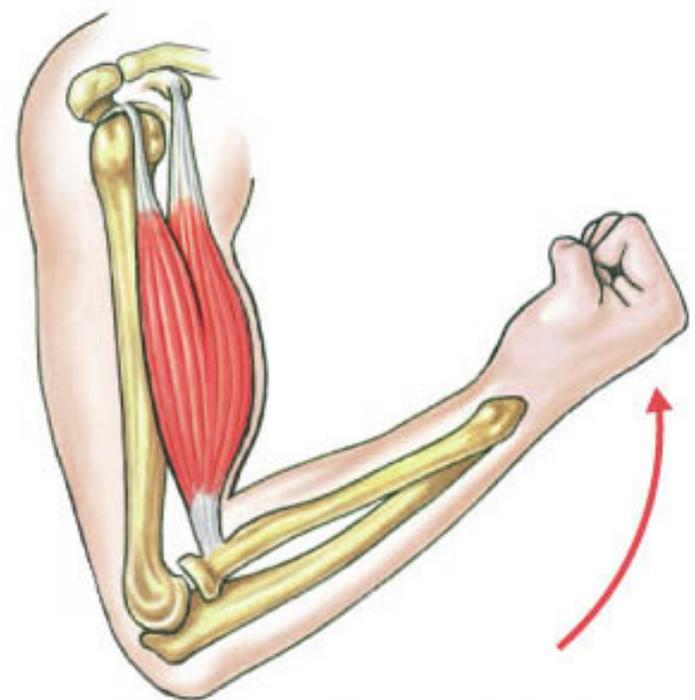

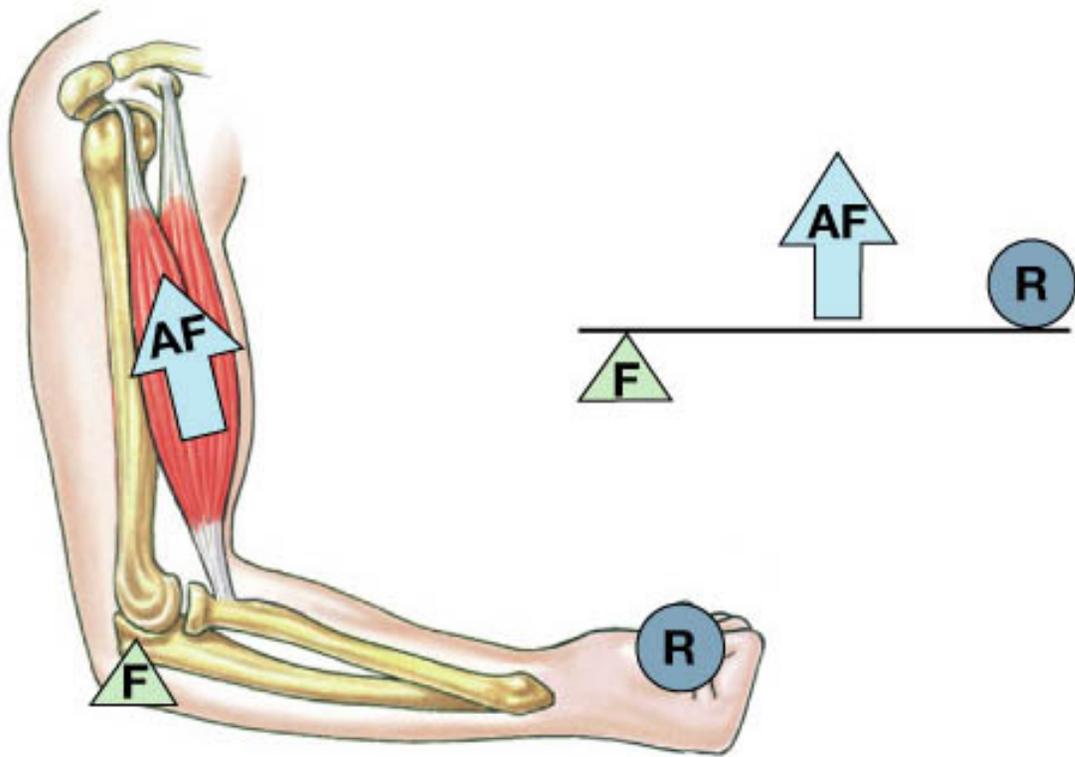

(e) Multipennate muscle
(Deltoid muscle)

Origins/Insertions/Actions of muscles

- Origins & insertions-the point on the skeleton where the tendon of a muscle attaches to the skeleton
- Origin-usually proximal to the insertion
- Actions-sarcomeres contract to pull the insertion closer to the origin
 - Move the skeleton (flexion, elevation, etc)

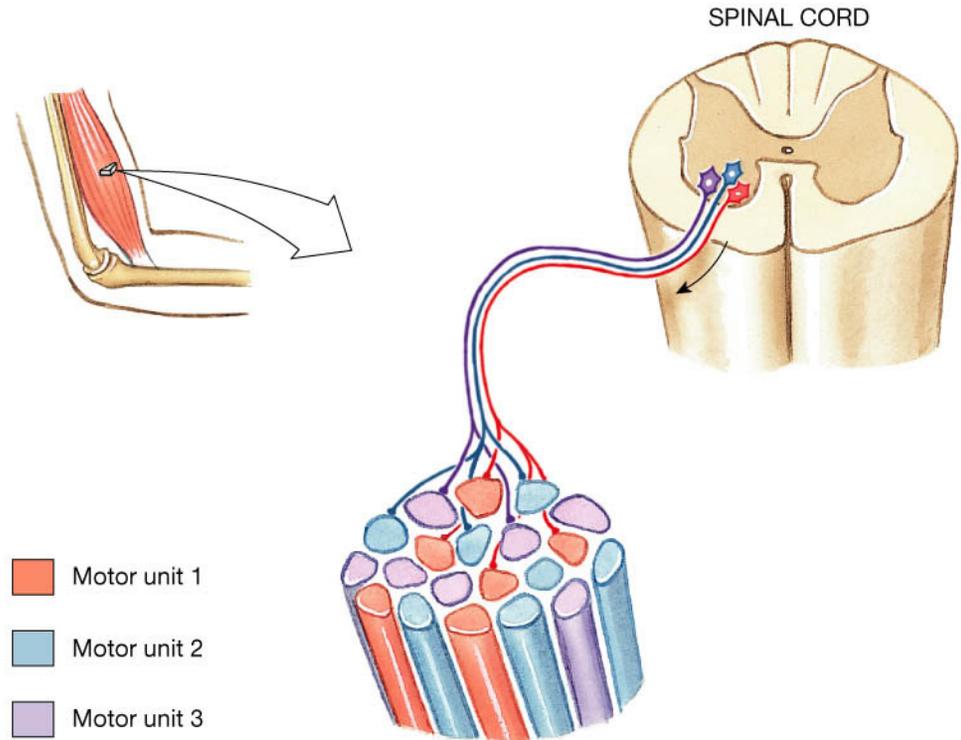

Movement completed

(c) Third-class lever

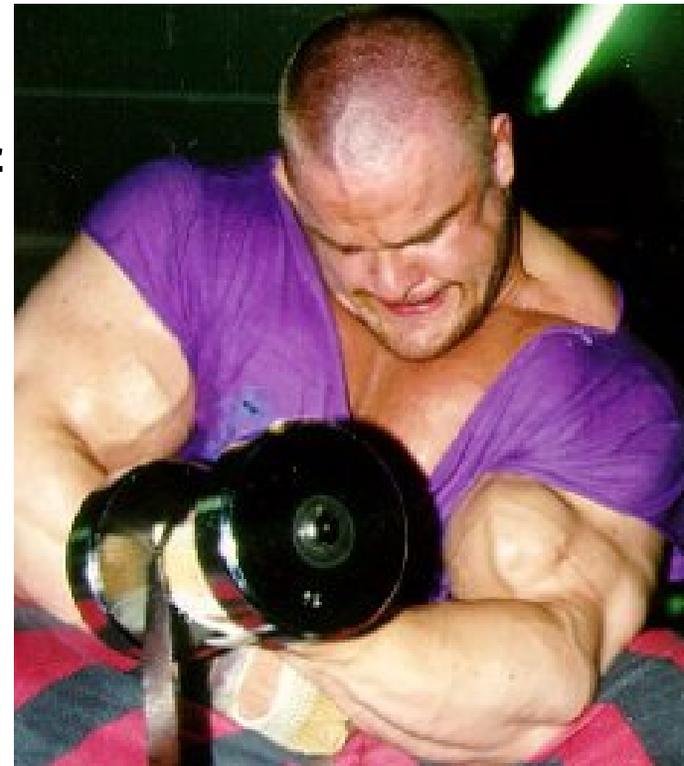

Motor unit

- All of the muscles fibers controlled by a single motor neuron
- Can range from 2 to 2,000 muscle fibers per motor unit

Exercise-muscle hypertrophy

- Exercise causes skeletal muscles to develop more myofibrils per sarcomere
- Hypertrophy of each muscle cell makes the entire muscle larger
- Increased concentrations of mitochondria & glycolytic enzymes

Sources of ATP in Muscle Tissue

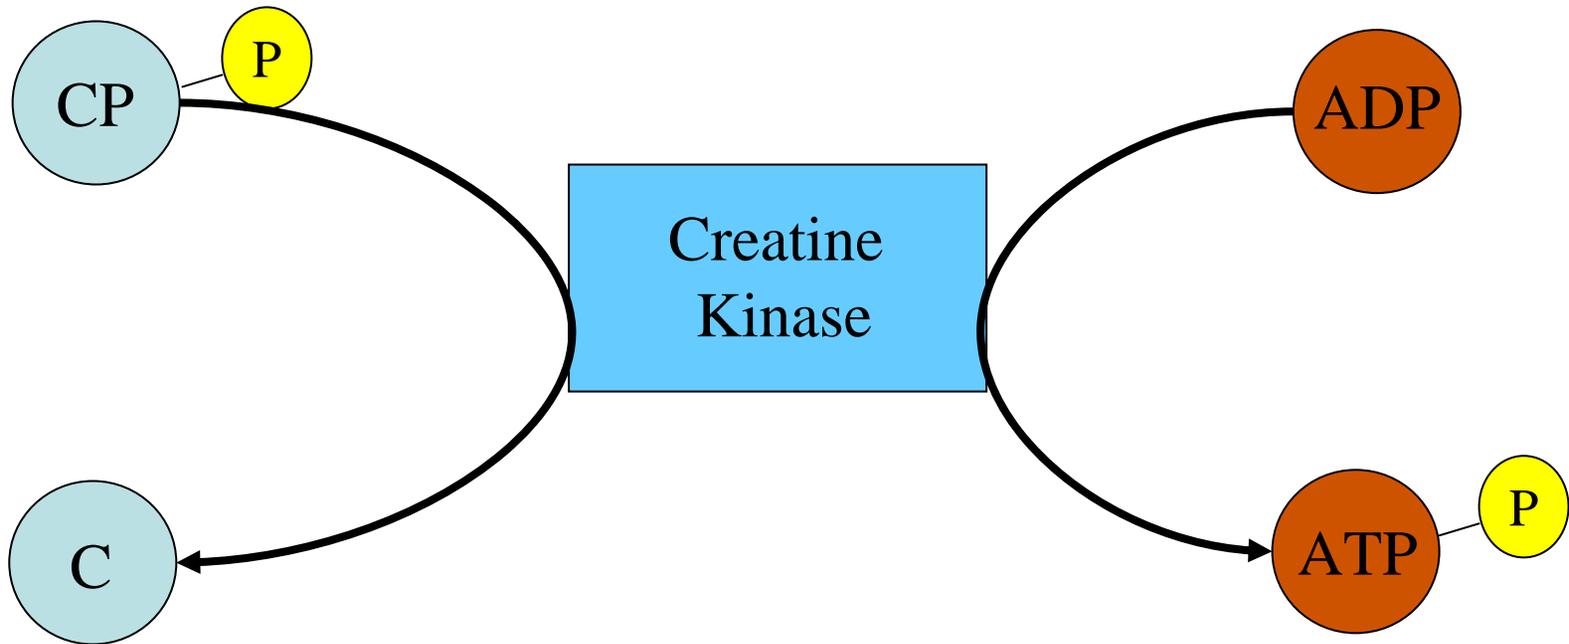

FYI

- 1) Immediate – Creatine Phosphate
- 2) Short Term – Glycolysis (Lactic Acid)
- 3) Long Term – Oxidative Phosphorylation

1) Creatine Phosphate

FYI

- Takes P from creatine and sticks it on ADP

Muscle Fatigue

Depletion of O_2 - decrease in ATP available.

FYI

Depletion of glucose or glycogen - decrease in ATP available.

Slows Na^+/K^+ pumps.

Lactic Acid Build-Up.

Motor neuron exhaust ACh: "junctional fatigue".

CNS (origin of signals) "central fatigue", mentally exhausted.

Types of skeletal muscle fibers

FYI

- FYI
- Slow red fibers
- Fast white fibers
- Intermediate fibers
- They vary in their blood supply, oxygen consumption, enzymes but that's physiology

1. Slow Twitch: Aerobic

- Slow onset of contraction
- Slower to fatigue
- More mitochondria
- More capillaries
- Myoglobin
- Smaller diameter
- Endurance activities
- Postural muscles

FYI

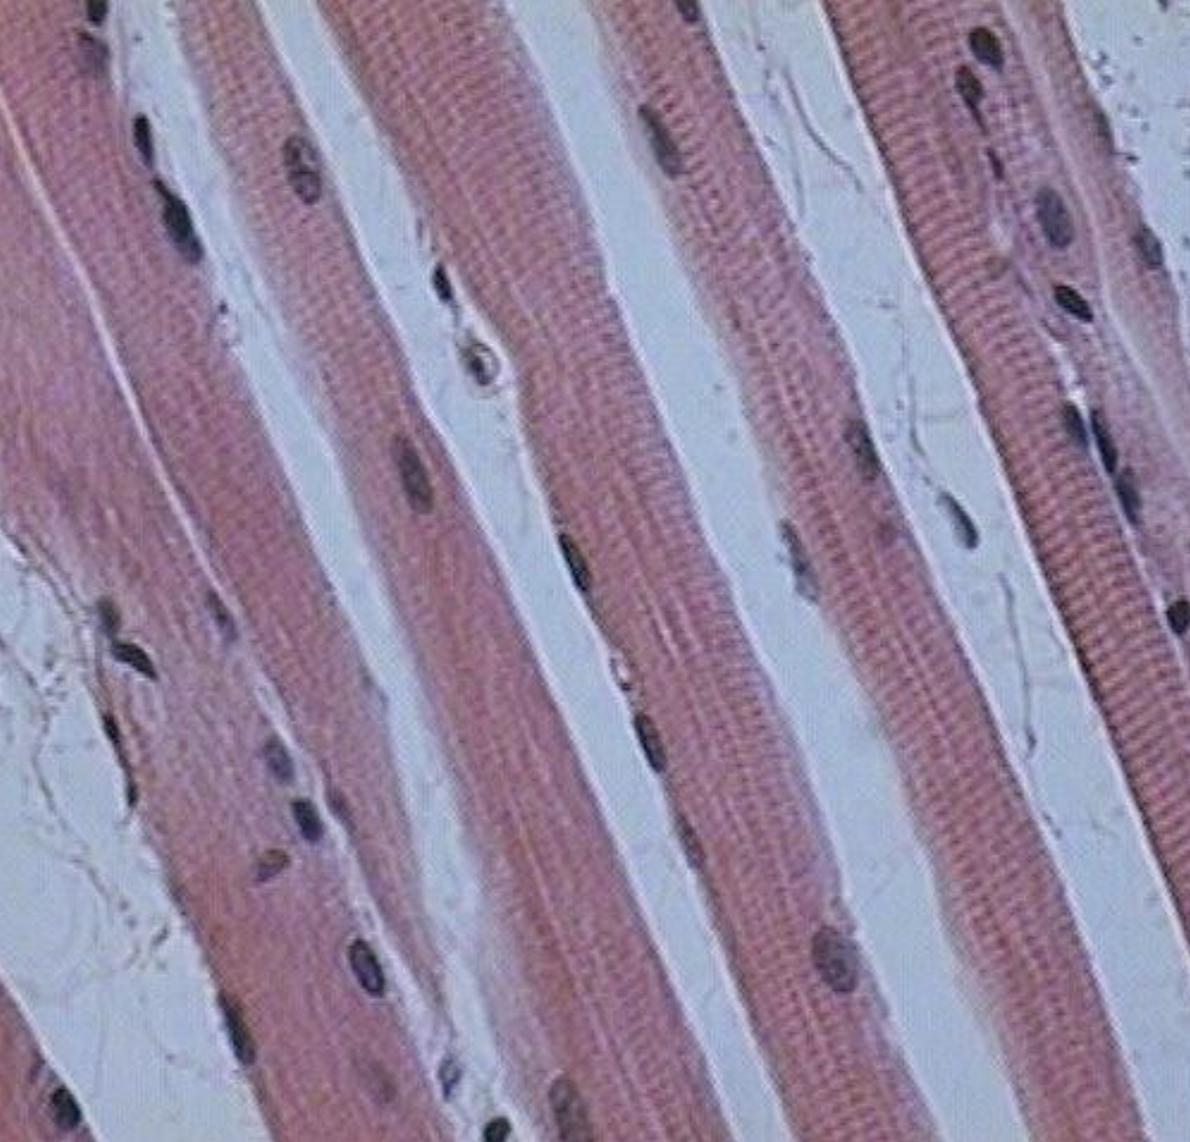

2. Fast Twitch: Anaerobic

- Fast onset of contraction
- Faster to fatigue
- Faster SR uptake of Ca^{2+}
- High glycogen stores
- Less mitochondria/blood
- Larger diameter
- Power lifting
- Sprint
